Actually I thought the quoted post hit pretty close to home on many points. He didn't really bash Atari computers (except to say that by today's standards they are obsolescent as *new* machines, which it's hard to disagree with); it really was a crticism of Atari Corp.'s management. Apple was in serious trouble not too long ago. They got out of trouble by putting lots of money into R&D and advertising (even buying the *entire* ad space in the election issue of Newsweek in 1984, not to mention super bowl ads). It's long been recognized even by Atari owners that Atari Corp.'s lack of advertising, and their failure to release competitive products since 1985 has put them in a very poor position in everything but the MIDI market. The typical comment here has been "the Falcon will turn things around." So the percerption that Atari has been making serious errors is hardly unique to Macintosh advocates.

(Remember when the ST was nicknamed the Jackintosh? Remember when you could tell people your machine was essentialy "just like a Mac, but with color?" Now Apple has 68040-based Quadras and the ergonomically awesome DuoDocks selling thousands of units a day, and Atari is still piddling along *trying* to get a machine out.)

BTW, maybe you initially misinterpreted "Atari owners" in

>>It just tells you the imcompetence of the Atari owners...You know
>>who you are!!!!!

as "people who own Atari computers," as I did at first. I think the original poster was actually refering to the owners of the *company*.

I have an Atari 1040STF with TOS 1.0 on board, These chips are socketed and I would like to upgrade to TOS 1.4 if possible just to fix a few probs with 1.0. Does anyone have an old set of 1.4 ROMS I can copy or know wher I can purchase 1.4 ROMS. I alreday have the TOS 2.06 upgrade in place, but would like to run 1.4 TOS and not 1.0 TOS when not swicthed to 2.06.

>>

>I guess when you get some real figures then we will listen! $1399
>where did you scrape that one from!!!!!
>What does tenth millionth mean anyway? :)

$1399?? Unless EVERYTHING Atari has said is a lie, that's their
suggested retail price for a 4/65 Falcon...

Which is being compared to the suggested retail prices for the new Mac's...

A TOTALLY valid comparison, and quite devastating to the Atari if you don't
really care about the DSP (sure it's nice, but - how many people today would
admit to having owned a TI-99/4A?? I did - it died just like Atari will if
things don't turn around in a hurry).. The TT030's are competitively
priced these days.. now if Spectre 4.0 would only come out :-)

Hello,
Over the past few months, a paper entitled, "Does America Say Yes
To Japan?" (Louis Leclerc 1992) has been circulated over various computer
networks and BBS's. Public response has been overwhelmingly positive.
The paper addresses the issue of U.S.-Japanese trade in the context
of our uncertain economic future. Mr. Leclerc provides the reader with
a wealth of referenced background and historical information concerning
our relations with Japan, as well as important facts concerning
ongoing developments which directly effect every American consumer/worker.
The paper, however, is not published and so is only available in the
form of circulating hard copies or electronic format. Anyone interested
in obtaining a copy of "Does America Say Yes to Japan" please send email
to:
ar12@quads.uchicago.edu

>*can* get a sample of the Macs.)

What's a Falcon like? Easy... it's just like your Atari ST/STe/TT with some new graphics resolutions and of course, the DSP. Seat-of-the-pants wise, it "feels" faster than a stock MegaSTe but definitely in need of a software accelerator such as Warp 9. Unless you are a musician or really "into" sound, I'd hazard a guess that the DSP won't mean that much to you until new software arrives which really makes use of it. But overall, the look and feel of the Falcon is that of a better ST... what the STe should have been. So given this, you already KNOW what the Falcon will be like to use on a daily basis. The largest differential in this equation is, of course, MultiTOS. It will make the Falcon quite different in use, to include, unfortunately, the number of existing applications which you can successfully use with it. The court is still out, but due back in session very soon. :)

Just my two quid on the matter. Your mileage (kilometers/liter) may differ. :)

[...lots of stuff deleted...]

All right, you all asked for it! Here's some colour theory I learned
in an advanced graphics course.

The number of colours the human eye can distinguish depends on the
way the colours are arranged. If two similar colours don't touch, the
eye has a much more difficult time telling them apart that if they
do touch. Now the next question is: Why?

(Brace yourselves...here comes the weird bit :-))

The cells of the retina work in the following manner: when a cell is
exposed to light, it actually inhibits the response of the cells
surrounding it. The more intense the light, the stronger the inhibition.
The upshoot of all this is that when a sharp change in intensity occurs
(say, the difference between grey 126 and grey 127), that boundary will
actually be exaggerated by the retina; The cells receiving the more
intense light inhibit the action of the cells receiving less light
more than the cells receiving less light inhibit the action of the
cells receiving more light. The net result is that the dim edge
appears dimmer than it really is, and the bright edge appears brighter.
To see this in action, find an object with a sharp corner on it, and
look at that corner as you rotate it under the light. The reason the
eye works this way is that it makes it easier for the brain to detect
the edges of objects.

So why am I telling you this? Well, this all relates to how many colours
people can see. If the colours don't touch (e.g. two ever-so-slightly
different shades of red set a few inches apart), the eye can distinguish
about 300 000 different colours. If the colours do touch, the number
is in the millions (though it IS less than 16.7 million).

I hope this clears things up a bit.

When you choose a new resolution for the workbench it resets the
Workbench but does not reboot the machine becuase you may have
other programs running on other screens. On a multitasking
machine it would be stupid to reboot just to change your
screen mode. (note: the amiga used to do just that with OS versions
prior to 2.0x)

>On the ST, it reinitialises the desktop. When you plug/unplug a mono-monitor,

It is ironic that this poster is out of Chicago -- he obviously doesn't know or doesn't care what Milton Friedman and any of the other Nobel Prize winners in economics in the last 20 years think of this protectionist crap the poster is pushing.

And it is crap -- of the foulest kind.

I can bet you dollars to donuts that neither this poster nor the original author of the article has ever heard of Ricardo's principle of comparative advantage -- known for 150 years in the field of trade economics.

Yet these guys spew forth this sickening yellow baiting as if they were well studied in all the ramifications of trade. hoo haa. What crap.

3088. The difference between 1040STf and 1040STe

Newsgroup: comp.sys.atari.st
Date: 1993-02-19 22:03:05 UTC
From: cscullio@ncratl.AtlantaGA.NCR.COM
Message-ID: <91365@ncratl.AtlantaGA.NCR.COM>
Source record: 209877

Okay, I haven't really cared up until now... I've been perfectly happy
with my stock 1040STf. But it's been totaled by lightning damage and now
must be replaced. So, I'll be getting a 1040STe. What's the difference?

Here's what I'm fairly sure of:

- additional graphics modes (but what are they?)
- memory is upgradeable via SIMMs
- improved sound capability (but what, exactly)

And now, additional questions:

- is the internal floppy the same (i.e., 720K)?
- any other new ports?
- what version of TOS comes in the new STEs? Any significant improvements
over my old TOS 1.4?

No, I can't wait for the Falcon. No, I don't want a Mega. I like what I had
before... it did what I wanted as fast as I wanted... I was content.

3089. FTP mystery solved!

Newsgroup: comp.sys.atari.st
Date: 1993-02-19 23:14:18 UTC
From: foroughi@cs.arizona.edu
Message-ID: <32856@optima.cs.arizona.edu>
Source record: 209878

Thanks for the overwhelming response to my post! I even received quite a few replies via E-mail. Instead of sending separate replies to these individuals I decided to post my reply here on the Net.

The problem was in setting up Kermit in my local UNIX environment. I never set the file type to binary. I kept executing Kermit in UNIX and then Uniterm. Then I would click on "Binary Mode" and "Receive" on the Uniterm's Kermit Dialog Box. At the end of file transmissions I would get the "Successful!" Alert Box Message, which I believed!

The short and sweet of it is that I was sending the binary files in text format but receiving them in binary. One would think Kermit should be smart enough to catch that. Anyway, now I feel like a kid loose in a candy store while browsing the various Atari ftp sites.

Thank you all for your helpful advice.

They have a program out that lets you switch to any resolution on
a multisync without rebooting. I can't recall the name but I
believe Talon has it. I'll try to find it and post it.

If you have ever seen any of the results of Midi in the US, the
Atari holds a lead over all other computers in the MIDI market.
The Amiga holds less a margin than the C64! IBM is not much
higher than that. MAC is the only competitor at all.

When we talk standard here, we don't talk about the computer
working or not. RThey are talking a standard library format and
other stadards so all MIDI created files can be used on any
platform. Atari had a huge dealing in that desicion. A lot of
what Atari allready had was used for the standard.

3094. Color and Colour

Newsgroup: comp.sys.atari.st
Date: 1993-02-20 01:57:13 UTC
From: mrz5149@ritvax.isc.rit.edu
Message-ID: <1993Feb20.015713.14915@ultb.isc.rit.edu>
Source record: 209884

Shouldn't this disucssion be on alt.linguistics or something?

Just to clarify for those of you out there who speak the British dialect
:-)

The example of color and collar are good. The answer is simple. They
are pronounced totally differently.

Color: 'kulur *or* 'kuler
Collar: 'kahlur *or* 'kahler

I could see how this might be difficult to hear if you haven't lived in
the culture for awhile.
BAD off topic thread starting question
I always thought that the "u" was silent in colour?

No matter. Let's get back to some ATARI talk. Shall we?

When Bob Brodie demoed the Falcon at our user group meeting, one user brought some MODs and a MOD player and it worked fine. I don't think there was anything in the AUTO folder. I remember the words "Light" and "Legacy" in the title screen, but I can't remember the name of it. It's the one that looks like a CD player.

Atari seems to have finally gotten it right. SpeedoGdos took not more than 5 minutes to install, along with AtariWorks. The install program asks you where you want it to put the Printer Drivers, and where you want the fonts, and then goes and does it all for you. There isn't any ASSIGN.SYS nonsense. There is a simple .ACC for changing the assigned printer driver and another for which fonts are installed. Nothing to the latter, it presents you with a list of all your Speedo fonts and you click on the ones you want.

Atari Works is quite nice, ala MS and Claris Works for those who are familiar with those. Quite simple, intuitive, and easy to use. Little icons for right, left, center and full justification, line spacing, type style, etc. Also has a text macro thingy for assigning up to 10 Font/character styles to the function keys. This lets you do thing like use 12 pt. Charter font for the main text and 10 pt. for sub and super scripts, with great ease. Formatting is handled well and it has both a spell checker and a thesaurus. Both are pretty smart and have lots of words. Those of you who know Mike Fulton won't be surprised that the spell checker is ok, as he wrote it. The rest of AW was written by one man in one year. No overtime, all night programming binges. This is a good example of what can be produced by a non-team. A horse that looks like a horse instead of a camel.

Can't wait to drop over to Egghead this weekend and pick up some IBM speedo fonts.

Atari has had some good ideas, look at the Lynx, a great little game machine... extremely well done, but very one who has had one has had too many problems withtthem breaking! atari also does not support their products.. it is hard to find NEW lynx games in some places.. if segaor nintendo had that machine it would be a big success....

3101. shel_put() help please..

Newsgroup: comp.sys.atari.st
Date: 1993-02-20 06:27:53 UTC
From: rasas@minyos.xx.rmit.oz.au
Message-ID: <1m4j1aINNodq@escargot.xx.rmit.OZ.AU>
Source record: 209891

Hi,
I need some help on the shel_put function (ie. what exactly does it do?).
I've used this function before as implemented in Ian Lepore's (fantastic)
Gemfast libs. Now I'm using gemfast with the Sozo compiled MiNT libs and
the system crashes (and I _MEAN_ crashes).

Cheers,

Greg.

PS. When I was typing the newsgroup name I accidentally hit 'u' instead
of 'y' and didn't realise 'till I got to the end of the word atari..Looked
quite telling of the times...:)

>--

Because unlike the Amiga, the St has non-interlaced 640x400 video, warranting
a separate monitor because the 200 scan line color monitor can't handle it.
In my opinion this was a SMART thing for Atari to do, if inconvenient, because
once I had a mono monitor, I never used my color monitor again, and the display
is crystal clear at 70Hz. (and when i say Amiga, I mean Amigas that were
concurrent with the ST, not the 3000/4000/1200.)

|> different shades of red set a few inches apart), the eye can distinguish
|> about 300 000 different colours. If the colours do touch, the number
|> is in the millions (though it IS less than 16.7 million).

I've often heard people say that those 16.7 million colors are more than
enough since the eyes can only distinguish a couple of millions. What they overlook
is that it applies for one given scene. Imagine you are looking at a tree. You may
well distinguish a million of different greens and browns. Then if you look at the
sky you may distinguish a million of different blues and greys. Now if you look
at a tree before the sky, you will lose distinction for some of the colors, but that
does not invalidate the fact that you were able to see them in the first place.
To take a simpler example, just consider that there is only 256 different
shades of grey among those 16.7 million colors. And you will agree that you
certainly can distinguish more than that. Just have a look at any B&W picture.
So 24-bit colors may provide enough hues, but they certainly don't provide enough
shades for a given hue.

Olivier.

.GEM files are typically picture files, used in some desktop
publishing programs, like Ventura Publisher (IBM), etc.

(Posted to comp.sys.atari.st, as Atari displayed Photo CD compatibility)

Photo CD: New Business Opportunities for Graphics and Photo Professionals

While ulimately aimed at consumers, Kodaks new technology initially is attracting graphics professionals. Software announced in August will let DOS/Windows and Mac users read and save Photo CD image, adjust colors and enhance pictures.

Features added to Kodaks's Photo CD system will allow sound, text. and graphics to be recorded along with photo-quality images onto Photo CD discs. THe discs, which will be housed in attractive "jewel boxe" case displaying the recorded images, will play back on TV, using dedicated Photo CD players.

For nearly two decades, Peter Mackey has been creating audiovisual presentations and video productions for busines and industry.

As vice president-media integration at Imergy, and interactive multimedia production and graphics firm in Norwalk, CT, Mackey is a beta site for the much heralded Photo CD technology on the way from Eastman Kodak Co. Simply stated, Photo CD puts 35mm film photos onto compact disc.

In August, Kodak announced software that lets DOS/Windows and Macintosh users import and enhance Photo CD images, plus a host of new formats and functions aimed directly at graphics and photography professionals.
Beta Tester Mackey is using Photo CD to produce narrated essays, captioned photo albums, and other projects that he is more secretive about. These have given him an early insight into the value of Photo CD.
"If designers and artists can personally experience what these products can do," said Mackey, "I have no doubt that they will be sold on Photo CD."

Opens busines doors
For the computer graphics community, Photo CD promises to bring forth not only a robust, innovative medium, but also new business opportunities. Kodak itself is betting a large part of its future on Photo CD- essentially a hybrid electronic imaging/silver halide film-based technology intended to keep alive and hopefully grow users' ingrained habit of recording events and locations on film.

Kodak is pumping about $30 million dollars into an ad campaign to promote Photo CD products, banking that the technology holds out the potential to be a "VCR"-line blockbuster product.
While Kodak's ultimate focus is on the vast consumer marketplace where billions of dollars in film sales are at stake, Kodak is also very much aware that its battle also entails engaging the hearts and minds of the professional, industrial, and commercial computer graphics communities.
For it is the visually creative practitioners who are likely to be the inital benficiaries and trend setters in applying Phot CD in myriad, unforseen ways.

Photo Database
For computer picture professionals, Photo CD's greatest potential is as an input source for digital images used in computer-based presentations and computer graphics of all kinds. "We can use Photo CD as a photo capture and archiving system and also as a delivery platform," Mackey said.
While technolgy to scan film and hard copy directly to computer-readable media has been around for some time, existing systems work too slowly and cost too much for even high-volume shops. Photo CD overcomes this price/performance drawback.
The film scanner component if the Sun Microsystems-based Photo CD Imaging Workstation (PIW) digitizes a full-color 35mm frame into a very high resolution image- 2048x3072- in just six seconds. To achieve this level of resolution, competing scanners typically take several minutes.
Not surprisingly then, such fast performance also yields more palatble costs. Kodak estimates that a typical user will pay $20 to transfer a 24-frame roll of 35mm film onto a compact disc in Kodak's proprietary Photo CD format.

Bought Image Bank
Likewise, Photo CD will intrude in traditional photo sources. Wanting to encourage demand for images in Photo CD format, Kodak last year bought the Image Bank, one of the largest film stock houses in the world. Using the Kodak PIW, Image Bank will be able to transfer its hundreds of thousands of 35mm negatives held in inventory to Phot CD files rapidly and inexpensively.
On August 25, Kodk announced plans for a Kodak Picture Exchange to go online next year using the public telephone network, much like text and data networks such as CompuServe. The Kodak Picture Exchange will link stock photo houses, graphic designers, pubishers, and oher distributors of images, and end users.
Looking ahead, film will not long remain Photo CD's only image source. Kodak recently engaged Polaroid to manufature a Photo CD scanner to handle instant photos and existing prints whose negatives are lost.
Kodak will market the scanner as an accssory under its own brand name to be sold along with the PIW to photo finishing labs and others having the output volume neccessary to warrant purchase of the

$100,000-plus PIW system. Scanning capability is also being expanded to cover a variety of positive and negative film formats beyond 35mm- including 70mm, 120, and 4x5-inch.

Four Basic Subsystems
The turnkey PIW system consists of four basic subsystems: The film scanner, which digitizes negatives or slides, scanning film at a maximum resolution of 2048 lines by 3072 pixels by 12 bits in each of the primary colors; the Data Manager, which encodes the image data, automatically performing color and density adjustments; the Writer, which writes the digitized information to a Photo CD disc; and the Printer, which produces what Kodak refers to as a "near-photographic-quality" prints along with the thumbnail prints that serve as a
picture index on the Photo CD storage case.
The device also spews out standard-size prints and
enlargements up to 10 inches square.
There's even more functionality coming. Starting in 1993,
photo finishers will be equipped to record tet, graphics, and sound
on Photo CD discs; they will also be able to encode attribute data
and other information on the discs that enable non-linear sequencing
of the images to be programmed for playback.
Photo CD playback takes place not just on one's computer
display- where images can be manipulated- bit on an ordinary
television set. This is key to Kodak's making Photo CD a burgeoning
consumer electronics product.
Kodak's approach entails use of a specialized Photo CD player
that Kodak recently began shipping; and in a a stroke of consumer
merchandising foresight, the unit also plays back audio on ordinary
compact discs.
In all, Kodak offers a selection of four Photo CD player
models. A basic unit carries a $449 list price. But the top-of-the-line model offers some stunning capabilities. With it, an operator
can change the viewing sequence at will, zoom in or out of an image
using crop marks to focus in on any area of the image, and view the
images under manual control or by automatic timing.
This high-end player also incorporated a five-disc carousel
along with capabilites to handle composite video, S-video, and audio
output. Its price: $549.
Kodak is even working on the ultimate jukebox player for the
image junkie. It has exhibited a prototype player holding
approximately 100 discs- or a nominal capacity of 10,000 images. The
device selecs a disc, transports it to a built-in reader, and begins
reding the disc- all in four seconds.
For those who want to manipulate images and ultimately
incorporate Photo CD images into a properly-sequenced, client
presentation, Kodak launched at last month's MacWorld its Photo CD
Access software.
Available now for $40, it enables any user of PC Windows or
Macinosh to access any image on a Photo CD disc; select and display a
desired image or sequence of images; export the selected photo to a

file in such formats as EPS, TIFF, RIFF, PCX, and PICT; crop and otherwise edit an image and paste it into any image processing, desktop publishing, and other Photo CD compatible application.
In addition, Kodak offers PhotoEdge, a $139 program that lets Mac and Windows users zoom, crop, rotate, and flip Photo CD images; and adjust color, cotrast, and focus. For storage and retreival, Kodak will sell later this year its $399 Kodak Shoebox software for Windows and Mac users. The Shoebox also works with Kodak Picture Exchange.
Photo CD Access software, however, is a entry-level, interim package that will become redundant once traditional software packages become Photo CD enabled. Towards that end, Kodak also sells a Photo CD Access Developer's Toolkit, priced at $695, intended to encourage application devleopers and other third parties to incorporate Photo CD compatibility into their products.

Apple, Kodak Team
Apple announced Aug. 25 it will work with Kodak to incorporate Photo CD access into curent and future Macintoh operating systems. Apple is also building Photo CD compatability into its QuickTime multimedia software; Micrografx Inc. has done the same with regard to its Picture Publisher software; EFI for its Cachet color managemnt software; Corel Corp. for CorelDraw; and Media Cybernetics for the Halo Desktop Imager image processing package.
With Photo CD compatibility, a professional graphics creator will be able to import Photo CD images into an existing system, edit and combine them with other graphics, text, video, and audio elements, blending all of the disparate data types into a state-of-the-art presentation.
The Toolkit actually consists of a library of C language functions that (1) read images from Photo CD discs into memory, (2) decompress high-resolution images, and (3) provide basic image manipulation capability. The Toolkit cannot be used to compress images and write them directly to a disc; that is a task for the PIW system- a strategy adopted by Kodak to assure high-quality image recording on film.
In fact, Photo CD is a practicable technology because it utilizes image compression and decompression effectively. Just how Kodak handles this proprietary aspect of Photo CD turns out to be both surpising and ingenious.
A Photo CD image is actually sored five times at five different resolutions on the same disc; this bundle of digitized pictures is called an ImagePac.
At the high end- denoted by 2048x3072 as well as 1024x1536 resolutions- images are stored in compressed form to reduce storage requirements; the lesser resolution images- 512x768, 256x384. and 128x192- are stored in noncompressed form.
The different resolutions are used as follows: 128x192 for thumbnail index images printed on each disc jacket and used for image retrieval; 256x384 for previewing images on a computer screen; 512x768 for standard NTSC imagery; 1025x1536 for High Definition TV

(HDTV) signals; and 2048x3072 for output to high-quality print.

Fills Up to 6Mb
Each Photo CD ImagePac occupies a total of three to six Mbytes, depending on the actual high-resolution image compression achieved. With present technology, it takes about an hour to fill a disc with 100 ImagePacs on a disc.
What is of concern to end users is the type of CD-ROM drives neccessary to access Photo CD images. It requires an XA copact disc drive that supports so-called Mode 2 multisession operation, meaning that one 24-film roll can be recorded in one PIW session, and then at a later time returned to the photo finisher with another roll of film for recording on the same disc to add more image frames.
The Photo CD approach contrasts with traditional CD-ROM drives where an entire disc is recorded in a single session. In both cases, once recorded, the images in a given sector an be read repeatedly, but they cannot be erased nor can they be recorded over.
Such multisession drives wll be made by Philips, which along with Kodak co-developed Photo CD. Likewise, Sony, Pioneer, and Toshiba all plan to enter the market Photo CD compatible multi-session CD-ROM XA drives; the four manufacturers collectively account for 85 percent of the current market for CD-ROM dirves.
Aside from the question of its ultimate acceptance, Photo CD raises another issue of concern to computer graphics professionals: the viablilty of the compression step that causes the higher resolution images to lose a bit of clarity, an essential tradeoff in exchange for efficient data storage. Presenations creator Mackey insists that he can see no deterioration in image quality when eyeballing his Photo CD works. However, neither he, nor anyone else, has worked with the tchnology to create, for example. slick magazine covers and pages. In such applications, even Kodak offocials have conceded tha Photo CD images will not be adaquate because of resolution loss.
What about the use of Photo CD for high quality poster-size reproductions? One tell-tale experience is forthcoming from Alexandra Asmanis, creative director at Asmanis Design & Associates in Somerville, MA. Her design firm has begun an experiment to create 20x20-inch posters using Photo CD as an image source.
Image security is yet another concern to some professional designers, artists, and photographers. No encryption technology is encorporated into the basic Photo CD to help image originators protect their creations.
However, a Kodak Pro Photo CD Master disc, designed for professional photogtaphers and due to be available in the spring of 1993, offers three security features: a special identifier to indicate image ownership and copyright, the ability to place a watermark (such as "PROOF") over an image, and the ability to encrypt high resolution images. The Pro Photo CD Master disk, which otherwise looks like its consumer cousin, also will store images from larger film formats favored by pros- including 120 and 70mm, and 4x5-in., as

well as 35mm.
A long term threat to Photo CD is electronic cameras. True, current filmless imaging cameras already on the market are bedeviled by either high prices or unacceptably low resolutions. But in five to ten years, when solid state memories and higher capacity sensors become available, electrnic film cameras could give Photo CD a run for its money.
Kodak competitors have been slow to respond to the Photo CD challenge, content to sit on the sidelines and let Kodak take the lead- and the risks.
A few are even "supporting" Photo CD, including film producers Fuji and Agfa-Gevaert that will offer PIW equipment to photo finishers overseas for converting their own proprietary film into Photo CD format.
At least for starters, Kodak seems to have the Phoo CD field largely all to itself, with the computer graphics professionals having the opportunity to call many of the shots- at least, initially.

(Stanley Klein and Malcolm Stiefel have co-authored articlces for many years, for Computer Pictures and other publications. Klein is publisher/editor of the S. Klein Newsletter on Computer Graphics. Stiefel is a computer scientist at Mitre Corp.)

Does anyone have a copy of Ultima I or II for the ST? I'm trying to start an Ultima collection and am wondering if these titles are out there for the ST.

I'd be willing to purchase the game.

Please send any information to me via E-Mail as I don't visit the Internet too often. Thanks.

Fine, but the point being that minor variations off of the actual real color
can be used to fake the inbetween colors with a very convincing degree of
realism. As long as it looks ok, the human eye really doesn't care whether its
pure or not.

Once the Atari Falcon reaches the stores, the question is when do we have to wait for faster models, ie faster 030's and a line of 040 Falcons. Some one was claiming that Apple was looking at their pocket book by supposely offering incremental improvements. Well the Apple techi set that user straight since he is a member of the product team that created the Centris and Qaudra line. Atari has only offered incremental improvements...

The Question is when is Atari going to offer Falcons with slots such as the nubus archetecure found on the Mac line. That way it would be easy for hardware developers to develop graphic and video boards, such as the Toaster on the Amiga. Atari should get a clue...Who wants to buy a falcon if you cannot upgrade the processor and graphics...At least on the lowend Mac, ie the LC line and color classic their is a pds slot(except the classic I and II) where you can add a video spigot or a faster processor...

Its been seven months since Atari announced the Falcon, meantime Apple has moved on.... Why doesn't Atari buy or lease the NEXT factory in California. How come Apple can have their own factories and Atari can't...Time is runing out Sports Fans..

Is AW available now? From where could I order it? Is there a demo available?
Maybe just some digitized screen-shots so I'd know at least a little what to
expect?

What is this about IBM Speedo fonts? Is SpeedoGdos some sort of standard, or
can it just use different sorts of fonts?

-Matt

I was invited by Atari for an evaluation copy. It should be available in a couple of weeks. I was exchanging msgs. with Bill Rehbock on GEnie where I sysop an RT. He knows I inhabit a lot of online systems and more than likely figured that if I liked it I'd say so. I do and did. Its not perfect, but its very nice, especially for the newer computer user. Its a very nice combination of WP, DBase, and Spread sheet that should handle the needs of 90% of the people. I own a ton of specialized software, but don't really need more than AW for my checkbook register, the newsletter I publish, etc.

If anybody really wants info about Atari, Works or whatever, the best place I know of, short of going to Sunnyvale is GEnie, where I got to talking to Bill.

3124. Expander/Compress conclusions

Newsgroup: comp.sys.atari.st

From: winnipg@sys6626.bison.mb.ca
Message-ID: <7R0aZB2w165w@sys6626.bison.mb.ca>
Source record: 209764

First, my thanks to all who helped me in the finding and using
of the above programs. The reviews...
Expander takes a ss disk and converts it to ds without losing
any data. Does it work on copy-protected disks? Sort of. All 4 disks I
tried it on booted up ok. After that, things get iffy with some
programs not working 100%. If you want to try it go ahead, just make
sure you run it on a back-up copy.
As for Compress not compressing, someone told me that pre TOS
1.4 users have to use a cli to uncompress files because COMPRESS uses
both upper and lower case commands and old TOS' has problems with that
when it comes to TTP programs. All I know is that under CLI, I was
able to decompress files.

Hello all, I am a current(and very happy) Atari St user and BBS Sysop. I'm interested in starting a FAQ(Frequently Asked Questions) Sheet for people who have ST's and want to use a modem. We all know that the St is a powerful telecommunications tool. It would be a great help to people if they had a guide to go by when they wanted utilize the ST for such duties. So send any and all information, email to me (address below) about what you feel is important information that the Atari ST community needs to know. I would especially like to see the subjects of 14.4 modems, Brand compatabilty and the Serial Port problem addressed. With good response I hope to be posting the first FAQ by early/mid of March. Thanx in advance to all those who contribute.

3129. Hebrew Fonts for Calamus?!?

Newsgroup: comp.sys.atari.st
Date: 1993-02-21 16:00:00 UTC
From: Peter_Missel@k.maus.de
Message-ID: <A2961@K.maus.de>
Source record: 209769

Hi all!

Does anyone here know where to get "foreign" fonts for Calamus (SL)?

Urgently needed are:

- Hebrew
- Cyrillic (sp?)
- Eastern Europe

Very important: Homebrew quick-and-dirty fonts are useless here; we need them for large banners, so the font quality has to be excellent.

thanks in advance, Peter

"> >[Mark Santora]
"> stephan();
"When we talk standard here, we don't talk about the computer
"working or not. RThey are talking a standard library format and
"other stadards so all MIDI created files can be used on any
"platform. Atari had a huge dealing in that desicion. A lot of
"what Atari allready had was used for the standard.

The original poster was pretty directly stating that different MIDI _interfaces_ (implying hardware interfaces) require different software. And that is simply not true. There is no need to own more than one MIDI interface on the Amiga. I picked one up at random (bought it used from a friend) and it works just peachy with all the different MIDI capable programs I've tried it with.

As for standard library formats and such, I don't see a problem. Being able to use all MIDI created files on any platform is a great idea. Let's do it. Atari may have had a great deal to do with setting those standards, great. Now, let's write software using them. There is no reason one couldn't write Amiga software to conform to those standards. So, the original poster's reason for claiming that the Amiga could never make it as a MIDI platform is bogus.

stephan();

3132. Anyone know what these chips are?

Newsgroup: comp.sys.atari.st
Date: 1993-02-21 20:59:52 UTC
From: baffoni@phakt.usc.edu
Message-ID: <1m8qg8INNbv9@phakt.usc.edu>
Source record: 209772

Hi all,

I picked up some chips the other day from a guy selling used chips.
He said they were 1MB, but looking at the numbers, they look like they might
be 4MB simms (and I got a deal!). Does anyone know what the 2-chip simm
with model number on each chip being:

TMS44400DS-80

is? I realize that it is 80ns, but other than that, I haven't a clue. Also,
does anyone know if 2chip SIMMs will work in a TTram expansion card (like the
GEsoft card)?

Thanks,

MikeB

Please reply in email, unless a lot of people are interested in this bit o'
trivia.

>full 256 colors on any Atari Machine. (And will let you do all

Unfortunately this is not true. Photochrome does not run on the TT.
I realise in the first paragraph you admit that, but then in the second you say
"on any Atari Machine" and that can be rather misleading.

To be honest, I wish they would come out with a TT version of
Photochrome. Can you think of how cool it would be to see 640x480x19kcolors
(I think that is the number for the STe high-color mode) on a stock TT?
Whatever, you know what I mean.

Hello. I have been wondering about this for quite a while, and this looks like the place to ask, so here goes:

I have seen the SVGA palette described in a few ads as "an infinite number of colours", and I have heard PC guys say similar things when I ask them how many colours they can choose from in SVGA. Now, knowing what I know about computers, I find it hard to believe that there are registers capable of holding "an infinite number", so what gives? Is it a 16.8 million colour palette, or what?

Thanks,

Phil Martin.

Hello all!

I'm looking for help in using Schoonschip, a symbolic math solver program written for numerous computer platforms.

I have read through the provided documentation (the program is freely redistributable) and I am still quite confused! I have used Maple and Mathematica on various machines and haven't encountered much difficulty, but this program has me lost. I am interested in using this program simply because I do not have the money to purchase either of the above programs.

If you have used Schoonship, I would appreciate some help in solving some basic problems (differentation, integration, solving for one unknown, etc.). I haven't been able to make heads or tails out of the provided examples....

Thank you so much for your time!

OK, all you TT owners with more memory than I do, just piss off! :-) I only
have 2M of ST Ram, and here I'm hearing about people with 42M. I can handle
going to ISD/DMC and drooling over their 42M TT, it's everything else they
have that I want. But to hear about other people having the memory...

Anyway, my question is: On the ST Ram board from Atari, it obviously has
more than just a connector and the memory. Could anyone tell me exactly
what it is on board that's so special that TT Ram won't work without it?

And also if anyone knows of any cheap DIY yupgrades for more ST Ram.

I'd like to integrate a Falcon into the car so that it'd handle the job of
equalization on all 4 channels and have it set itself to be just exactly
perfect. ie generate some pink noise, analyze 4 different channels and set
each one to reproduce the required frequencies correctly.. Plus it'd be the
coolest if it were hooked up to say a 5" monitor in dash to give a
full-spectrum spectrum analyzer! And play games of course :-)

Source record: 209778

Speedo Gdos uses the Bitstream fonts. They are available all over the place, having been in the IBM world for years. There are around 1500 different fonts available. Prices of fonts are real reasonable too. Since the disk format is the same (on 3.5" DD disks) they are usable by the atari with SGDOS.

AW probably won't be available for a couple of weeks yet. I found a bug or two which they probably want to quash.

>a) true color == 24bit color because this is more (sort of) than what the
> human eye can resolve

>b) true color == does not use a color palette

EXACTLY. In the X-windows for "xdpyinfo" it has the following text:

```
visual:
visual id: 0x8006a
class: TrueColor
depth: 8 planes
size of colormap: 8 entries
red, green, blue masks: 0x7, 0x38, 0xc0
significant bits in color specification: 8 bits
```

HUH! An 8-bit TrueColor!

Those "masks" indicate that it has 3 bits red, 3 bits green, 2 bits blue.

So there you go.

Stop complaning about the 16-bit truecolour of the Falcon - 5 bits red,
6-bits green, 5-bits blue.

The xdpyinfo manual also mentions "PseudoColor" and "StaticColor".

```

> bitplane #0, y=1 0000000000000000
> bitplane #1, y=1 1111111111111111

hehe.... The Falcon (and ST and TT) interleave bitplanes at the word level, so this "copper-list" thingy is weeker. For example, to copy 16 word-aligned 4-bitplane-pixels, you only need to move a CONTIGUOUS 8 byte chunk of memory. On the Amiga, bitplanes are sparse. Normally, they are completely separate (eg. STLow on an Amiga would be 4 separate 8000byte exapanses of memory). The copperlist allows the interleaving to be done on a per-line basis - but that's not as useful as the Atari's word-interleaved format.

Yeah, there's this bunch of digi sound programs bunched together
called Digi Stuff!. In there there's a program called 'SPARC2ST' which
convertrs .au to atari format. Works okay, but the sound quality isn't as
good as the Sparc's. I *think* it's either on a.a or umich-edu FTP site
(I'm not sure which I got someone else to download it for me).

Hope this is useful,
-matthew

3142. Emacs: Bus Error w/ Garbage Collecting

Newsgroup: comp.sys.atari.st
Date: 1993-02-22 06:12:55 UTC
From: tevans%sunset.cs.utah.edu@cs.utah.edu
Message-ID: <1993Feb21.231256.10069@hellgate.utah.edu>
Source record: 209782

I have the recent version of Emacs from a.a.u.e (I believe
it is version 18.58) for Mint. Whenever emacs does garbage
collecting it always dies with a bus error. I have a
Mega2ST w/ 4 megs ram, TOS 1.4, and the stock 68000 processor.

Could somebody please help me to fix the bus error problem?

Thanks,
tevans@cs.utah.edu

>> *but* slow compiler, huge executables, needs much harddisc and RAM space
>> to use

"Huge executables" may bit a bit misleading. GCC can produce quite small executables, depending on what options you choose.

Optimizing will produce executables 1/2 the size of unoptimized code.

Striping the executable further shrinks it.

I have written programs that take about 200 BYTES, by using the minimal.h include file, osbind, and -nostdlib. Of course, this is getting into the realms of pointless, since blocks are AT LEAST 512bytes (and 4K on my drive, I think... not sure how that sort of thing works :-])

I think it is probably correct that IN GENERAL, the GCC executables are *slightly* larger than those of other compilers, due mainly to the complexity and thoroughness of the C library for GCC.

>occasions end up writing to the visible screen when using double buffering.

Neil, will this work:

```
FlipToScreen(char* screenpointer)
{
Setscreen(-1,screenpointer,-1);
Vsync();
}
```

If so, then MANY programs should work. Those that use:

```
FlipToScreen(char* screenpointer, int wait)
{
Setscreen(-1,screenpointer,-1);
WaitUntilThisManyVBLsSinceLastCall(wait);
}
```

Should also work.

Anything else sounds like "hitting the hardware"... and such code deserves
to die. I don't see think it is correct to say the Falcon's video chip
has a "bug" just because it isn't exactly the same as old ST chips.

Dave Baggett or I wouldn't send our ST back for repair just because some
program's "overscan" hack didn't work on our machines. (and probably
has BUCKLEY'S on a Falcon).

3146. MiNT ....also EMACS

Newsgroup: comp.sys.atari.st
Date: 1993-02-22 07:54:09 UTC
From: baffoni@phakt.usc.edu
Message-ID: <1ma0r1INN1id@phakt.usc.edu>
Source record: 209786

Hi all,

I have been massaging my system into shape but I have a few
questions.

I noticed, using the ps.cpx, that bootgem runs two processes. One
is about 28k, the other is about 1.2MB! Does anyone know if that is
Neccessary? If not, how do I reduce its size (I had thought it was all of
the allocations for bootprgs and .accs, but removing those didn't change
it by one byte.

I notice that when I boot, MiNT automatically runs TCSH, without
my having even selected the tosprograms.cpx. Is that a normal occurance
as well, or is there some way of inhibiting the initial startup of TCSH
(and no, it is not inited or execed).

My manpager is a bit funky. When I use less.ttp, it doesn't
interpret the escape codes correctly when I call man (from the man3 of
the Distrib_kit - Simon, I lost your address again, and the address in
the kit keeps bouncing). If I use more.ttp, the screen looks correct
(inverted letters, etc.) but in neither case (more or less) can I man
the man1,man2 etc. docs, only the files in cat1, cat2, etc. I keep getting
an error of "cannot open c:/lib/tmac/tmac.an". Is there a setenv that
I can set it to look in the right place? BTW, I made a c:/lib/tmac/tmac.an
by copying the one installed in /usr/local/lib/nroff to c:/lib/tmac but
it still couldn't open it.

I installed emacs 18.57. I only get two errors. One is that it
can't find the documentation dir. What files should I get for that, and
what env should I use? The second error is that it can't find user
'baffoni'. I have set the HOME env to point to /usr/users and put
my emacs.rc file into /usr/users/baffoni (USER=baffoni), but it still
doesn't see it. Does emacs (the mint compiled 18.57 version) use some
other variable besides HOME to find the user dir?

If someone can help me with these questions, I'd really appreciate
it!

-MikeB

I'd say "true color" is approached only by NTSC, where there's no digital
color at all... the exactness of your color selection is limited only by
the sophistication of your equipment.

Plus, it gets "about" 4 million colors, which is enough for me.... 8)

3148. WARNING: ICD 6.0.6

Newsgroup: comp.sys.atari.st
Date: 1993-02-22 08:36:41 UTC
From: a740778@gus.tiuk.ti.com
Message-ID: <C2uD96.33D@csc.ti.com>
Source record: 209788

Last week I grabbed a copy of ICD 6.0.6 from ftp.uni-paderborn.de. I had no problems with it on my TOS 1.0 1040STF. However, I gave a copy to a friend with a TOS 1.4 MEGA 2 and within 2 hours of him installing it his top level directory on the partition he was using got wiped. All he was doing was editing files.

Luckly, the FATs were not damaged, and he was able to reconstruct subdirectory entries in the wiped top level to recover most of the data on the partition.

I've since switched back to 5.6.0 which I've had no problems with.

Anyone had similar experiences? My friend has a micro-SCSI adaptor and a Segate drive.

>from Dave Baggett! :) [I'm assuming Neil used such screen code in GWB]

On pre-Falcon machines, a change to the physical screen address will not
take effect until the next VBL. On the Falcon it may take effect immediately
if the video hardware is not accessing screen RAM. ie. the top/bottom border.
Setscreen does not take this into account so don't use it. Write your own that
takes into account what machine you are on.

Bashing documented hardware locations in a documented way is approved by
Atari. It has to be. How else could you perform smooth scrolling or virtual
screens on STE's and up. There are no system calls for that.

Dave trusts my judgement in proportion to how close the matter is to the
hardware. I guess I'm just the Game Workbench BIOS! :-)

3152. MIDI help required Urgently!

Newsgroup: comp.sys.atari.st
Date: 1993-02-22 10:34:23 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Feb22.103424.3793@dct.ac.uk>
Source record: 209792

Hi. It's me again, the one with endless atari problems!

This time, it's with midi. I have just obtained a PSS 788 (or something) yamaha keyboard, and quite nice it is too.
What I want to do with it is to use it a sender to STE, with STE playing samples in answer to the keypresses of the keyboard.
Fine.
I have searched all over for a program to this nicely for me.
TCB Tracker does it, albeit a second or so after the midi-keyboard note was hit!
The demo of Stereo Master I have does it very nicely indeed, but with limited octave range, and is only one note polyphonic.

The best I have seen yet, is Audio Sculptures Tracker program, which is excellent but often goes mad, as seemingly the keyboard decides to bombard it with crap, resulting in the mod in memory to play at light speed!
The appaling noise that follows can only be stopped by holding CNTRL, but this usually pointless, because it usually crashes shortly after. It is the midi that is causing the trouble, as if I load it up with the keyboard off, or detached from STE, it works fine.

Basically I need a tracker program very much like the one above, but without the errors. (Yes, I did try changing Midi Channels!)
It would be nice if it was 4-note polyphonic, too.

Can anyone reccommend a program to the jobs I need?
Or can anyone think of solving my problem with Audio Sculptures Tracker?

Any help would - as ever - be greatly appreciated!!!

One more thing, has anyone seen UNIT 17's Dynamite STE music demo?
It's not bad. It claims that if you plug a midi keyboard in, you can use their sounds like a synth module. Either it doesen't work, or you need to press something to get it working. Anyone know?

Yes! My keyboard is working fine, as I use it with Pro12 and things.....

Thanks!

Feekzoid

3153. Overscan help needed too!

Newsgroup: comp.sys.atari.st

Source record: 209793

Problems, problems, problems!

Hallo!

In numerous archives I found a little program called OVERSCAN3.
It sounds very promising indeed!
However, I have an important question!
Does anyone know if the hardware modifications are possible on my 1040STE?
Will it work?
Doesen't STE have overscan anyway?

Okay, so it was more than one question, but I desperate here!

Thanks again....

Feekzoid

3154. MiNT, minixfs, gcc & gdb problems.

Newsgroup: comp.sys.atari.st
Date: 1993-02-22 10:37:46 UTC
From: gadget@dcs.warwick.ac.uk
Message-ID: <1993Feb22.103746.29369@dcs.warwick.ac.uk>
Source record: 209794

Hi,

I've recently installed a minix filesystem on one of my hard disk
partitions, and put MiNT, gcc etc onto it. Firstly, thanks to
everyone involved in writing this stuff, it really is very good.

If got a couple of problems, though, and I wonder if anyone could
help.

1. Is there any way of accessing the minix partition from within GEM,
or do I have to have MiNT running?

2. I'd really like to get gdb working in this setup. I've got the
version of gdb from atari.archive (Gnustuff/Tos/Gdb), but
I'm having some problems with it. Firstly, when I run a program
in gdb, it immediatly receives a signal 0, which doesn't sound
at all right. If I continue the program, it then runs normally.
Secondly, gdb seems to want to load symbol tables from somewhere -
how do I get gcc to generate these tables? I have found that
giving gdb a .o file for the symbol-file seems to load in the
symbols for that file, but this is no good in a program with
multiple source files! (Trying to load a second .o simply replaces
all the symbols) I have tried to RTFM, but it doesn't seem to
mention these problems. Please help!

3. Is there any way of preventing gcc from using all the available
memory when it runs? Again, I've looked at the manual page, and
it doesn't look like a command line option. Do I have to get
the source and compile it diferently?

Replies by email to me, please - lets try and save some bandwidth!
I'll summarise replies in a couple of weeks.

Cheers,

Steve

Hi,

I went to the "7th International Computer Show" at Wembley this weekend.

The Falcon was there! There was a `Falcon Feature' with 4/5 Falcons being demo'd by 3 guys (who didn't appear to be linked to Atari).

Atari was not there!

The 3 guys demoing the Falcons were really unhelpful, they would only answer questions with 'yes' or 'no' and were not prepared to say much at all. One of them said that the Falcon would be released in the UK on the FIRST OF MARCH. He also said that case redesign was a *long* way in the future. Is this true??

New desktop is pretty nice, no MultiTOS though. Most of the Falcons had Atari PTC1426 (sp?) monitors/Systems Solutions monitors (17"). ST (Low/Med/Hi) resolutions were instantly recognisable.

.Ian.

The guy from Atari at the International Computer Show in London
on Saturday said they had sold 450 TT's in the UK.

A specific number at last?

David.

I went to the 7th International Comp. show at Wembley, London on Friday,
and a spokesman from Atari UK who was giving a questions & answers
thing said that the release dates were :

March 1st - Music stores

March 24th (CeBit) - Official European launch - All good Atari dealers

Incidentally, he said that the Falcon was NOT late in Europe.
All developers at a developers conference last year were told March 24th
was the release date, and that it was the press that was saying it was
ready/not ready !

^^
Doubtful... the copperlist allows you to do many tricks practically impossible on the Atari.

|> For example, to copy
|> 16 word-aligned 4-bitplane-pixels, you only need to move a
|> CONTIGUOUS 8 byte chunk of memory.

So? The Amiga's blitter can still do just 1 operation, so for it it's the same.

|> On the Amiga, bitplanes are
|> sparse. Normally, they are completely separate (eg. STLow on an Amiga
|> would be 4 separate 8000byte exapanses of memory). The copperlist
|> allows the interleaving to be done on a per-line basis - but that's
|> not as useful as the Atari's word-interleaved format.

Why?

Acording to EGM (March '93), Atari's Jaguar can 'out-shoot' (in EGM's
words) the 3DO. They say that this has been confirmed by 3 different sources
(I assume the sources are 3rd party developers).

This has probably already been replied to, since my unread articles
counter reads 160 odd at this point, but I'll reply anyway...

Photochrome. This is the best GIF viewer that I've seen, and I've seen
a fair few of them. The only problem is that it squashes the Gifs to
fit into the screen unless you choose an area to view..Also file size
is limited to about 250K on a 1meg machine... Don't know where you can get
the GIF version of this from, but its well worth seeking out.

DMJ Gif.. although the unregistered versions are very slow, this is the
second best GIF viewer. It can do everything...Scale the piture to ratios
you give it, work out how to fill up the screen for you, tell you which
dither is best...It does it all...Available definitely from atari.archive,
and almost definitely from most other FTP sites which do atari stuff

Hope that helps,
Martin

I went to the 7th International computer show on Friday.
Atari were there giving out information about the Falcon.
This is what I picked up from them. It seems there will
not be a new case for a while but they were reluctant to
say when, there are basically 4 versions of Falcon and up
till now everybody has a version 3 whose got one. From
1st of March V.4 will be out promising to be slightly faster
than previous version and be more compatible with the STE
than earlier models. At the show were shown pre-production
models and being run on these were a Genlock using the
Falcons 32768 colour overlay mode, a PC emulator, a Falcon
with a CD being played into the mic then being modified
in real time by MUSICOM before being output giving effects
like graphic equalization and a host of special effects
like reverb, echo, hall etc., there was also a demo of
screen balster on a 17" screen at 880x608x256 colors.

If anybody out there is interested in becoming a developer
the deal was this. You buy the developers kit for 250 pounds
and get 25% off the price of the Falcon030-4/65 which means
you pay about 930 pounds in total.

Also at the show were Hisoft who had a demo Simply the best
running by Tina Turner on the Falcon and also the walking
bird demo.

16/32bit PD Library had a Falcon running some of the new
PD items slowly appearing on the Falcon, a mod player,
a few application etc.

The show to me though was the smallest it has been for some time.

Jon

> by copying the one installed in /usr/local/lib/nroff to c:/lib/tmac but
> it still couldn't open it.

First off, man4 has been out for a while now. It means that man ought
to run under MiNT >0.95.

My address is below. If you can't get through on this something is
wrong between you and me - I get of the order of 100 mail messages a
day, so I'm pretty sure my site is ok.

less is an accurate description of what it gives you. Use more instead.

If you're having problems like that, then I assume you're using the
minixFS partition. Try getting mfsconf.ttp from a.a.u.e in mfs055.zoo
and executing a 'mfsconf <drive>:/ -s t'. That ought to amke sure that
the man program will work.

This is a temproary patch, I'll eventually get nroff to understand
what a lowercase filename is.

To avoid confusion, go through your cat* directories and remove all
files of less than 80 bytes - they'll be just failure messages from
nroff.

The reason nroff is looking there is that that is the default place
for nroff to find its macros. The environment variable TMACDIR cannot
have been set. (Although I was under the impression that SETUP took
care of that...).

in sh, do a 'TMACDIR = /usr/local/lib/nroff ; export TMACDIR'
tcsh, do a 'setenv TMACDIR /usr/local/lib/nroff'

Can't help you with emacs I'm afraid. Every version I've pulled just
bombs on my STe (4Mb). Hence Jove :-)

Simon.

I recently called ICD, and they told me:

a) The latest version of the software is 6.0.7.
b) They do not want their software uploaded to BBS's (or presumably ftp sites)
without their permission.

They told me that their BBS is the best place to get their stuff. It supports
96k modems.

I've had similar problems when I INCORRECTLY installed the upgrade from
4.0.x to 5.x.x. I recently upgraded to 6.0.7 about 2 months ago and have
had *NO* problems. Maybe 6.0.6 is buggy and/or was not meant to be
released to the general public?

Later,
Bernard

Yes!!! I also use 5.6.0 and am extremely cautious now about new versions of ICD software. Basically, the first ten sectors were garbaged, and I had to rebuild the first fat from the second. Also had to write basic drive info, too. Interestingly, I also have a micro-SCSI adaptor. My drives a Maxtor, though...

Yeah, but 3Do is going to cost $700! What is Jaguar going to cost??

Now, I've been waiting pacently for the next artai game system. I would of
bought a lynx, but alas, I only have one working hand. I figured that $200
would be to high of a cost. After all, I did buy a sega genesis for $220.
But if its going to cost $1000, I don't think so!

STE improvements:/

TOS 1.62
Blitter (enhances block-data copying etc.)
4096 color palette, instead of 512
DMA Chip (giving up to 50Khz, Stereo sound output, via the stereo ACA
jacks on the back of the machine, or through a stereo monitor)
Disk drive, standard 720K drive
> - additional graphics modes (but what are they?)
> - memory is upgradeable via SIMMs
No additional graphics modes, just more colors, but RAM is upgradable
with SIMMs

> - is the internal floppy the same (i.e., 720K)?
> - any other new ports?
> - what version of TOS comes in the new STEs? Any significant improvemen
> over my old TOS 1.4?

Floppy is the same.
New ports, the STE has Analog 'joystick' ports, which were never used
(although there are light-pens, and a couple of games support them,
but that's about it)
The Stereo-output plugs on the back.
TOS is 1.62 (or, 2.06 if you want), which is virtually identical to 1.4,
except with different bugs, (very few), supports the 4096 color palette,
the blitter, nothing really *new* compared to TOS 1.4!

Basically the whole machine works faster if things are done supporting
it, looks better, and sounds better!

>million colour palette, or what?

Well, there is no such thing as an SVGA standard, therefore the palette
tends to vary quite a bit among the different boards. In its most minimal
sense, SVGA does not extend the palette beyond basic VGA and in fact only
provides resolutions other than stock. Any board which can display 256
colors in greater than 320x200/400 resolution could be called SVGA, but
most now support 640x480 and higher resolutions in 256 colors.

The stock VGA palette is only 18bits, limiting the number of possible colors
to 256k, with only 64 levels/shades of red, green, and blue. Most of the
SVGA cards also are limtied to this palette, unless they have a 24bit RAMDAC,
allowing for full 24bit color. The HiColor modes supported by some SVGA
boards allow for 32k or 64k simultaneous colors, but these colors are not
from a palette. I'm not positive, but simple math shows that there can only
be 32 shades of red, green, and blue using the 32k color mode, and possibly
64 shades of one of the colors (green, most likely) in the 64k color modes.

I have a 24bit RAMDAC in the machine that I use at work and it allows for
any pixel to be one of 16.7M colors in the 640x480 mode. However, when one
uses the "standard" modes, the palette is once again reduced to a mere 256k
colors in order to remain compatible with existing software. The only apps
that can use the 24bit modes run under Windows, therefore the 24bit ability
is basically wasted for me, except for showing off.

The reason this is done on the atari is that the two monitors have different scan frequencies. Tha color monitor is a 60Hz analog monitor while the monochrome is a 70 hz digital monitor. Putting the signals for one into the other would destroy the monitor so atari made it so that on the ST when you switch monitors, the machine will completly reboot. This is changed on the TT where you can change the resolution without rebooting the machine, although Atari didn't link it up with the change resolution option on the desktop. It is just an XBIOS call.

In the TI34076 Video Interface Pallette data book, it states that it has 3
TrueColor modes. A) a 15 bit Truecolor (Targa) with 5X5X5 representation.
B) a 16 bit Truecolor (XGA) with 5X6X5 representation.
and a C) a 24 bit Truecolor with 8X8X8 representaion.

Therefore the Falcon does have Truecolor included no matter what anyone says
about it.

i need to get an memory upgrade (to 4 meg) for my old 520 st
i've just wiped a pound of dust off of.

does anyone know of a good place in the boston area to get it?

please respond in email

thanks
jacob

ps: is it useful to get new TOS roms? (my st is a 1987 or 1988
vintage)

3190. recommendation for (1) HD (2) C compiler sought... [?]

Newsgroup: comp.sys.atari.st
Date: 1993-02-23 00:32:02 UTC
From: jacob@max.cc.brandeis.edu
Message-ID: <1993Feb23.003202.1365@news.cs.brandeis.edu>
Source record: 209730

i'm trying to decide on a hd for my st. which ones could
you recommend?

incidentally, i seem to recall that a few years ago a guy
who designed a mac emulator for the st (i forget his name
or the name of the emulator) poured praise over one specific
hard disc he had just aquired. i might be wrong but i'm pretty
sure i'm not mixing two threads in my mind here.

i thought i had jotted down that information at the time but
i don't seem to be able to locate it now. does anyone recall
this and which hd it was?

then i need a "good" (don't we all?) c compiler. i'm not necessarily
looking for great performance but for good fairly standard libraries,
reliable code and easy access to MIDI programming (this is what i intend
to use it for, although i would need a few mathematical functions
such as rand()) and if possible a nice programming environment.
furthermore i wouldn't want to spend an arm and a leg on it.

what would you recommend?

please respond in email. thanks.

jacob

Assuming they use a standard 68881/68882 math coprocessor socket, it is impossible. The coprocessor socket brings out a full 32-bit bus (though there's no guarantee the Falcon drives it with a 32-bit bus, both FPUs also support 8 and 16-bit bus operation), but they only get a couple of address lines. I suppose if there's no other socket available, that would at least get you half of the way toward some kind of memory kludge. You'd be far better off usurping the CPU socket and building some kind of CPU/memory tower, but chances are they're using the cheaper 132 pin PQFP version of the '030, which would be virtually impossible to tower.

> But if its going to cost $1000, I don't think so!

According to the Software Industry Bulletin, Oct.26,1992, v8, n10, p1:
I quote paragraph #4 from the article, "Atari plans a 64-bit game machine."

"Jaguar's heart is an Atari-designed, 64-bit custom RISC chip manufactured by Motorola. Atari plans to release the machine in June witha target price of $99. The company acknowledges, however, that the SRP [Sugested Retail Price] may end up anywhere under $200."

This means to me that street price should be between $99 and ~$150.

This is about the most solid information I can find. :) Enjoy!

-Matt

Considering what you wrote above, you probably should keep quiet.
I have an A500, I have 1 (one) midi interface. Here is a list of midi
programs which I have used using the same midi interface.

Delux Music Construction Set.
Bars and Pipes.
SuperJam.
Music-X.
M.
Sequencer One.
Octamed Pro.
Tiger Cub.

That's eight different midi programs which all work on the *same*
midi interface. No adjustments of any kind were required for any of the
programs I have mentioned. What was it you were saying about incompatible
interfaces?

3199. GEM library for MS-Dos?

Newsgroup: comp.sys.atari.st
Date: 1993-02-23 07:34:18 UTC
From: berger@duterl.et.tudelft.nl
Message-ID: <1993Feb23.073418.8989@donau.et.tudelft.nl>
Source record: 209738

Hi,

I need a GEM library for PC's (Please, don't hit me!) I like my computer and like the way GEM works, but the Atari world is very small, and therefor it would be nice, to be able to compile & link my original Atari sources on a PC.

Last week I started writing a GEM lib, but when such a lib already exists, this would be useless.
If anyone know where I can find such a lib, can you please write to me?
Please reply to me in private netmail....

Thanx in advance,

Jeroen Berger.

3200. SLM804

Newsgroup: comp.sys.atari.st
Date: 1993-02-23 08:33:09 UTC
From: jriegel@polyslo.csc.calpoly.edu
Message-ID: <1993Feb23.083309.23531@rat.csc.calpoly.edu>
Source record: 209739

I recently got an old SLM804 from a friend, and I was wondering if anyone could recommend a good word processor to use with it. I've been using 1st Word Plus with the Laserbrain epson emulator I found on umich, but unfortunately Wordplus has no font or graphics support and doesn't handle proportional text correctly. I'd really like to get a PD or shareware word processor if one is available, or a reasonably cheap commercial one.

Also, has anyone managed to hook an SLM up to a PC? My friend wants to print some stuff from MS Word. I thought of having him save it as postscript, and then using ghostscript to print it from the ST, but I haven't had any luck getting ghostscript to work since I only have 1M of ram.

Thanks for any suggestions.

-Jeff

3202. Learning to program STs... How?

Newsgroup: comp.sys.atari.st
Date: 1993-02-23 08:43:39 UTC
From: kllove@skyhawk.ecn.uoknor.edu
Message-ID: <C2w88v.8nF@constellation.ecn.uoknor.edu>
Source record: 209741

I'd like to write a few games and maybe something productive on the ST, but I have no idea how to do so. <sniff>

They don't teach practical programming here at O.U. and I'd like to learn how to do some actual, real-world programming on the ST (and, if it's applicable, in the MS-DOS world). If anybody can recommend some books or magazine articles on things like graphics, animation, sound samples, and/or game design then I'd be eternally grateful.

I have 'Atari ST Internals' by Abacus Books but it went into far more technical detail than I was ready for. I have Abacus' "GEM Programmer's Reference" but haven't looked at it yet (the 'Reference' part of the title is what's keeping me away... I need a tutorial not a reference).

I am fluent in Pascal (Unix version only) and xBASE. I'm growing more accustomed to Turbo C and have an acquaintence with Fortran, COBOL, BASIC (various flavors), and C++. Therefore, I don't need my hand held (such as "This is an 'IF-THEN-ELSE' statement and this is what it does" foolishness) on basic programming skills. If I have to put up with some hand-holding of this type to get hand-holding for the other stuff above, I can but I would prefer not to.

I have Personal Pascal (unopened), and GFA BASIC v3.01 (yes, John [a.k.a. "No worries mate!"] I know that I should upgrade to version 3.5 ASAP :), and Lattice C v5.0. That should cover any language specific tutorial/guide. (I hope!)

BTW, I've seen an ad for a book by Clayton Walnum called "C-Manship Complete" (or something similar). The blurb below the picture of the book sounded like it might be what I need. Has anyone got any experiences with this book that they would like to share? Which flavor of C does it use? Does it come with a disk?

I guess that's all. Comments and suggestions are welcome!

adTHANKSvance,
Kenneth Love

Farhang Foroughi (foroughi@cs.arizona.edu) wrote:

: I wasted at least six hours! Do a good dead today, help a fellow Atarian.
: Thank you in advance.

I have heard that when uuencoded data is sent over the net it passes
through several computer systems some of which use ASCII and others
ISO code. Certain ASCII characters used by uuencode (circumflex ^ in
particular) do not have an ISO equivalent and can get translated
in a different manner by each machine that processes the data.

I got some files from Italy once that were screwed up in this way. It
was noticable that the lines of uuencoded data were not of equal length.

That I think may be your problem but sadly I can not offer a solution.

3204. Christmas WISH LIST revisited!

Newsgroup: comp.sys.atari.st
Date: 1993-02-23 09:17:49 UTC
From: kllove@skyhawk.ecn.uoknor.edu
Message-ID: <C2w9tv.98F@constellation.ecn.uoknor.edu>
Source record: 209743

I'm back to a daily schedule of reading c.s.a.st after a 3 month hiatus and I thought I'd let you know how my memory upgrade went.

Some of you may remember (though you all probably want to forget 8) that around mid-December I asked c.s.a.st what they would buy for my system with $100 (or less). A surprisingly (to me at least) small list of items was generated (1. TOS 1.4, 2. Warp 9, 3. More memory, and a couple other items that I can't remember right now [it being 2:53 AM and all]).

I chose the memory upgrade since I wanted to do more in the DTP area and set up MiNT/GCC/etc. on my machine (2 MB, Mega ST w/ TOS 1.02 and 105 hard drive).

Now that I have the memory refreshing done, I'll tell you my experiences with the upgrade.

Finding the 2 megs of RAM turned out to be harder to find than I thought they would be. It seems few are selling anything except SIMMs nowadays. After asking several people, I finally remembered TOAD Computers. Initially, they weren't willing to sell the chips to me "because we don't normally sell the chips". But I'm NOT going to send my computer from Oklahoma to Maryland no matter how much I like the company! Eventually, they sold the chips to me for $69 + $5 shipping + $5 C.O.D. = $ 79 (all prices in U.S. dollars).

Since I am not confident enough to take a soldering gun to a computer (much less mine), I started calling around trying to find someone to install the chips once I got them. I was referred to / found 3 people. One was willing to install them and guarantee the work for free if I could get some schematics and instructions. The second would guarantee his work for $60 (and didn't need instructions). I never was able to contact the 3rd person. Needless to say, I didn't get any instructions (things almost never go my way).

Net cost == $139.

From this I've concluded that whomever said I might be able to get Warp 9 with the money left over from the $100 is: a) un-realistic, b) has a source he/she needs to let the rest of us in on, or c) crazy.

Later,
Kenneth Love

well, others might also like my advice :)

There is a GEM existing for PCs, but it comes from another vendor,
not atari (is it DR?).
It is a bit different in it's outer look, and you might have
to change your sources ... i don't know, because i never tried
to write GEM software.

Keep hackin'
Walter.

|> Last week I grabbed a copy of ICD 6.0.6 from ftp.uni-paderborn.de. I
|> etc.
|>
|
|I recently called ICD, and they told me:
|
|a) The latest version of the software is 6.0.7.
|b) They do not want their software uploaded to BBS's (or presumably ftp sites)
| without their permission.
|
|They told me that their BBS is the best place to get their stuff. It supports
|96k modems.

Does their BBS also have a TCP/IP address?
I have the impression that many Atari users only use their (slow)
modem (if they have one) to log into their companies/institutes
facilities, and prefer to use ftp (or telnet) to go further than
that. Evidently, many home-user oriented companies/organisations
don't bother about supporting those users (who cares about some
academics and engineers?).

3209. falcon sound question A1200 bus contention.

Newsgroup: comp.sys.atari.st
Date: 1993-02-23 12:16:39 UTC
From: d1dol@dtek.chalmers.se
Message-ID: <d1dol.730469799@dtek.chalmers.se>
Source record: 209748

Well I have a few questions regarding the Falcon.

from what I've read there is an internal IDE bus, how good is it?
(EI. how many connections etc.)
Could you just plug in an IDE hd straight away?
(size limitations?)
Is it similar to the A1200 one?

Is there any Bus contention on the A1200 with Fastmem?

How are the spec's on the atari DSP chips, I know it's 16 bit - 50 khz,
but how good does it sound?
Could you compare it's sound quality with a quality Sampler (eps, S1000, etc)

Is there any proffesional music software announced for the falcon?
(ei. Sequencer with simultanious sample player?)

I know the built in Midi interface on the St's is'nt quite standard, but
how about the falcon one? is it more powerful?

Has anyone else encountered the following problem(s) in F-19 Stealth Fighter from Microprose: when I load the game and choose the levels etc. the game screws up giving me missions. Specifically, on strike missions it gives me "Destroy AN-72 flying to..." for both missions, although both are strike missions. If I look at the "mission targets" selection it tells me the correct strike targets...but if I then attack those I get no credit for completing the mission. This does not happen every time, however it is annoying!!! Also, has anyone EVER had missions to land at clandestine runways, to drop supplies behind enemy lines, or to intercept a cruise missile? If so...what levels etc. were you playing on? The missions are getting quite repetitive and I would like to try some other ones. Any help etc. is appreciated,

T.T.F.N.

No.
It can be purchased from a company by the name of 'Blade' software.
The Game is FANTASTIC.
- programmed by a brilliant programmer, who also wrote titles such as
Laser Squad, Rebel Star I & II, Rebel Star Raiders (remember anyone?)
GREAT GAMES!!!!!

That's my bit....

3213. AMIGA VS. ST

Newsgroup: comp.sys.atari.st
Date: 1993-02-23 13:53:20 UTC
From: psteindl@amiga
Message-ID: <1993Feb23.135320.27161@rzu-news.unizh.ch>
Source record: 209552

Well then,

I think it is time I write my 0.02$ into this group...Well, atarians are fighting against amiga users since these two machines exist (oh no, don't tell me you don't...), and as I see, they have NOT grown up. Besides: I had an amiga 500 (was a great game machine :)), then I bought an Atari Mega1 (got 2 synthesizers at home) and now i own a pc486 in addition (for school, using unix on it...). The A500 had the greatest games, the atari was unbeatable in text and midi (at these times; and even today I think you will have difficulties in finding such a sharp and cheap monitor like the SM124...). Now i use the PC as a powermachine, since it is faster than the 040 next of my friend (a real lot faster...).
The following now is IMHO:

- You cannot beat the atari in midiprogramms....theres no such thing like creator, notator and all these fine editor programms (Don't come with bags'n'pipes...thats funny, but not as mighty...). MIDI: well, it could be standarised on the amiga, just like a sound blaster on a pc, let's say an inofficial standard. Still, there are additional costs...

- You cannot beat the amiga when working with video. Since its resolutions are mostly (or all?) videocommpatible, its for sure the cheapest machine u can get (there are also the programms for it: scala and such). The attribute "game machine" can no longer be applied (since an a4000 is a good machine, I just miss the DSP (I am making music :)) and the scsi onboard like the a3000 had...). Maybe I'm wrong...but working with a cheap amiga without good monitor and the amigas strange resolutions (1280 x 200...wow) can be a bummer to zour eyes...

- You cannot beat a PC when it comes to a cheap and fast machine, but you will have to fight with lots of IRQ and DMA stuff as well as with drivers and so on...lets say the ancient design of a pc...if u get all done, it works fine. With new technologies (like Localbus, which can move ca. 180 MB/sec on a 50 Mhz dx) most problems are avoided...

Well, this is from a view of a user...not a programmer. If you are using C, well, it's nearly the same on all machines. Coding assembler is another chapter and I think Intel Chips can break your skull :-).
What i wanted to say is: Most computers can hadle many jobs, better or not. (You can even write your dissertation on an A500 and raytrace pictures on a monochrome Atari ST, but does this make much sense?). I am awaiting the Falcon 040 now, since its DSP and rumours about 50Mhz can push it to a true and professional sound sampler while having enough power to drive a unix or such (nextstep for falcon? :-)). If they integrate variable resolutions (do they?), I think it would be superior to an a4000, but at what price, I dunno..
The problem is, atari and commodore make great computers...but both companies

have a very strange management concept....atari is always too late and commodore doesn't take a shit (sorry) if their users have new ideas or problems with their machines (atari is not better, either....)

Ok,,,I think that was it

Well, don't flame too much :) maybe my english is not too good, so there can be things, that sound wrong. Keep your machines and be happy with them, there is no sense in a "mycompisbetterthanurscauseithasthisandthatatthisprice-war". Each machine has advantages to another one (even if it is only the price :)). My dream would be something like a mixture of an a4000 and a falcon 040...

3214. Falcons in the UK

Newsgroup: comp.sys.atari.st
Date: 1993-02-23 14:07:59 UTC
From: thumpy@dcs.qmw.ac.uk
Message-ID: <1993Feb23.140759.22680@dcs.qmw.ac.uk>
Source record: 209553

I just spend an interesting hour or so on the phone trying to get hold
of one of the birds. Basically, the two places who reckon they'll have
them in stock NEXT WEEK (like the man from Atari said at the Wembly Computer
Show) were

Evenlode - tel 0993 898484

and

ABC Music (Kingston) - tel 081 546 9877

These are both music - related suppliers.

Both companies said that the price for the 4/65 beast would be 999 pounds
stirling, a rise of 100 pounds from the previous estimate due to the
pound's shite standing in the exchanges at the mo'.

For those interested, Cubase's RRP has apparantly risen to 399 pounds.

Both places also had D2D's 2 and 4 - track recorder software for 150 and
300 quid respectively. This s/w can work concurrently with Cubase 3 to
give you direct-to-disk recording sync'd to your MIDI efforts. Yummy.

Your's now-200-quid-poorer-than-I-was-10-minutes-ago(20% deposit)

>The 3 guys demoing the Falcons were really unhelpful, they would only
>answer questions with 'yes' or 'no' and were not prepared to say much at
>all. One of them said that the Falcon would be released in the UK on the
>FIRST OF MARCH. He also said that case redesign was a *long* way in the
>future. Is this true??

I went to the show on Friday. The Falcon Feature was being run by Compo, and the guys you talked to were some of the developers. The guy with the Screenblaster was one of its developers. I'm not sure why you thought they were unhelpful - I was chatting to them for ages, one guy especially - seemed nice enough to me!
I would not believe all that they told you - after all, they are not from Atari, they are only developers, so they would not be up to date on things like the case design etc. I asked one if the case shown was the final design, and he said it was, but then half an hour later, an Atari guy said that it would be changed eventually. He also said that the Falcon030 was the first in a long line of Falcon machines, and they intended to keep them at the cutting-edge of technology.
I got the impression from talking to various people that the Falcon040 would be 'announced' before August this year, possibly at Cebit.

Atari were there in a way. At 12 and 2:30 two guys from Atari came along to answer questions on the Falcon.

See my previous post for the official release dates.

Atari said that they did not have a stand there because the guys high up had said that the official Euro release was at Cebit , and no earlier.

Hisoft had MultiTOS, I think it said v1.1 when it booted up, I'm not sure. I did notice one thing about it - if you try to change resolution with MTOS running, it says something like 'You must close all applications before changing resolution'. As far as I could see, the only thing running was MTOS itself. Was I seeing things or is this a rather stupid bug/idea?

Hisofts True Paint looked pretty good, in fact the JPEGS were absolutely stunning! I could not even see the pixels! Flipping pictures horizontaly and vertically was done in less than 2 seconds, with instant redraw once

it had thought about it. It loads every picture format imaginable, with more added just by having another loader for a new format on the disk.

>(I hope!)

Yeh, get that upgrade in ASAP, Kenneth! And then buy a "GFA Basic Toolkit" book and disk from Taylor Ridge Books. Nah, better buy 100 copies. :)

>BTW, I've seen an ad for a book by Clayton Walnum called "C-Manship Complete"
>(or something similar). The blurb below the picture of the book sounded
>like it might be what I need. Has anyone got any experiences with this
>book that they would like to share? Which flavor of C does it use? Does
>it come with a disk?

If you are going to attempt programming the ST in C, I would definitely recommend picking up Clay's "C-Manship Complete" book _and_ disk. It's one of the best general C tutorials around and it is ST specific. It was written around Megamax's Laser C which is no longer available, I believe (and does not support STe features) but is generic enough that you should have little trouble converting to Lattice C or some other flavor. For more specific info, contact Clay at (203) 643-9673.

>I guess that's all. Comments and suggestions are welcome!

OK, you asked for it. Here's my $0.02: If you want to program for fun or just for yourself or just to experiment, then use GFA BASIC. It's quite easy to learn and use, has a tremendous command set, is fast and fairly efficient, and has a large established user base. HiSoft's new BASIC is supposedly very good, too, although not as widely in use as GFA.

If you want to learn to program in hopes of eventually marketing your software or padding your resume with useful skills, then go with C and eventually pick up C++. The learning curve is steeper, granted, but the potential rewards are greater. You just don't see a lot of ads for "BASIC Programmer Wanted." :) Don't get me wrong, you _can_ program commercial quality apps in BASIC, but the transition to other platforms in C is easier.

This is complete rubbish. The ST (and the Falcon because porting will be easy) has a very well established base of MIDI software. People peddling the useless opinion in the previous paragraph must be (I presume) operating outside the world of music.

Take a look at just about any music magazine (for amatuer OR professional musicians), you'll see Atari kit more than any other computer kit. This may well change, but for now Atari will be bought for MIDI in preference to other machines.

> did you pull out your other figures from?

I read them somewhere years ago. Another poster claimed I was wrong. Maybe.
However they then claimed the human eye sees 256 red, 256 blu and 512 green
levels. Now *I AM* prepared (in fact I do) believe the human eye sees different
RGB components with different resolution, but I find it hard to believe it
is on a perfect power of 2 boundary, next thing I know I'll be the Terminator.
>
> The 256K colors are as evenly spread as if you had a linear
> DAC. What do you mean by evenly spread? By the DAC's view,
> by the monitor's view, or by the humans view?

By the human's view. This must be the case, because otherwise the picture
cannot be claimed to be 'real life realistic', only photorealistic...

Spot the difference? (I'm getting to like this phrase :-)

Didn't Apple sue Digital Research a while back on GEM infringing on the MAC GUI they took from Parc Place, resulting in PC GEM having some functionality removed. Atari snuck by on a grandfather clause, I believe.

So I think the two GEMs have diverged. I think the only thing I've used PC GEM for is GemDraw. Is there even an Atari version of GemDraw?

I'd like to know where you got that kind of bullpuckey. Most studies I've seen show few can distinguish more than about 2,000 different colours, not 7,000,000. And I've NEVER seen any rigourous studies demonstrating sexual dimorphism in colour recognition. Heck, I've never seen ANY studies claiming sexual dimorphism in colour recognition.

I don't usually include such large articles, but FLAMEBAIT is FLAMEBAIT.

This is total rubbish. TRUE COLOUR may be a trademark. Fine, it's a trade mark
owned by a company for their own ends.

Also

TRUE COLOUR is a standard term for refering to a particular video mode when working with X windows. Direct Colour (spelling is color...) is also another mode for using with X windows.

Lets use an analogy with the C programming language...

```
enum my_daft_flame_enum {
DIRECT_COLOR,
TRUE_COLOR,
PSUEDO_COLOR,
ANOTHER_COLOR
};
```

Here TRUE colour does not mean 24 bit colour card, it means the value 1, as defined by the ANSI standard definition of the C language. Now another example...

```
enum my_daft_flame_enum {
DIRECT_COLOR = 24,
TRUE_COLOR,
PSUEDO_COLOR,
ANOTHER_COLOR
};
```

Here TRUE colour does not mean 24 bit colour card, or the value 1, it means the value 25, as defined by the ANSI standard definition of the C language.

In short words mean what they mean in the relevant context. Your post went on to claim that TRUE COLOUR in the X Window System was incorrect (as well as a bunch of other assumptions). You are incorrect.

TRUE COLOUR should mean, looks (on the screen) like it does in real life. Whether it does or not is another matter. Looks like AT&T will have to take everyone to court for using TRUE colour to mean a variety of things including having more or less colours than 16.7 Million or the value 3.

That said I think 32,000 colours isn't enough.

Goodbye, that was fun.

3226. Atari 7800

Newsgroup: comp.sys.atari.st
Date: 1993-02-23 18:16:28 UTC
From: rcmerrit@apgea.army.mil
Message-ID: <1993Feb23.181628.21826@apgea.army.mil>
Source record: 209565
Cross-posted to: comp.sys.atari.st,rec.games.video

ok, I applogize for posting this here once again, but I don't have access
to rec.video.games nor do I desire all the verbal abuse from nintediods.

I called up Atari and got them to send me a list of the Atari 7800 games they
still have in stock for sale.
I am looking for descriptions and opinions of the follwing games for the 7800.

1,Alien Brigade
2. Fatal Run
3. Jinks
4. Midnight Mutants
5. motor Psycho
6. Planet Smashers
7. Scrapyard Dog
8. Dark Chambers

and the following are 7800 that I know what they are, but I need opinions
on how good the Atari 78
00 version is:

1. Xenophobe. (I've spent big bucks on the arcade and rented the nintendo
version. This is the one I must know about)
2. Super Huey
3. Ninja Golf
4. Joust
5. Ikari Warriors
6. Fight Night
7. Dig Dug
8. Deluxe Asteriods
9. Commando

Thanks everyone.

By the way, if you want to get the catalog, you call Atari at:
(408)745-2000

Rob Merritt

> 50 levels each of RGB also == 50 shades of grey, which is
> quite easy to shw as inadequate.

Right, I think I've caused enough confusion, wow such a tirade of opinion started from my humble "SPOT THE DIFFERENCE POST". Firstly I think where I went wrong is that the numbers I had (the 40 levels...) is probably for night time viewing, when the colour receptors don't work very well. So I was probably talking about part of the eye we don't use for looking at colours. More fool me for the extrapolating this behaviour (without even thinking of checking my workstation next to me :-|) to colour receptors.

Note 50 shades of grey on a monitor is not a test of your B/W receptors in your eyes, it's a test of the colour receptors in your eyes.

It would be much better for a biologist to comment on these ramblings.

Hmm, how can an Atari do worse than a MAC? The software is generally
written by the same people, or in the cases when it isn't someone else has an
equivalent piece of software on the other platform.

A boring old ST can out perform a boring old MAC, even when running an emulator
(GCR SPECTRE, or something along those lines), and it has more screen space.
Now if your average musician can afford a
top-of-the-line-I-really-have-too-much-money-to-spend MAC (and I wish I could)
then they may do that, or alternatively buy a top of the Atari and spend the
difference on some nice gear for their studio, which is what I'd do.

Also it doesn't help if people like you go around being so pessimistic. You
can't have heard John Major going on about people "talking Britain down" -
not surprising since his government helped put us here.

Interesting note... I heard that Dixon (Oslo) sold out ALL their 1200s in the
first 15 minutes (about 30 of them). Now, they won't be getting anymore until
June (because C= can't get them either) - so if you bought your 1200 at Dixon and
it doesn't work... Tough. ;)

As for C=, they got 600 1200s, having asked for 900 - They were calling round to
dealers asking if they could make do with fewer machines! Well, at least they're
selling...

: snail@lsl.co.uk

My wife is taking a medical imaging course and her reading materials
say that the number of grey levels a human eye can discern is between
16 and 32, but never more, so I'd be very surprised at 256 color levels.
The key is "discern" - i.e. with a grey scale of 32, a person can tell
the difference between any two adjacent grey levels, but not with a grey
scale of 40 or 64 or 117! Any two different colors with an appreciable
difference in saturation would be easily discernable, but I'd be willing
to wager that it would be tough telling the difference between a level
one of a 64 level blue scale from a level 1 of a 64 level green scale.

In article <1m6bnr$3uq@bigboote.WPI.EDU>, Brent Burkholder (eyeq@wpi.WPI.EDU) wrote:
: One second.... may be only 256 "perfect" greys in the 24 bit range, but what
: of all those thousands of "off-grey" colors that you can get by adding or
: subtracting from 1 to 5 of the value for a given color. Take for example these
: colors: (128, 129, 128), (124, 128, 128), (130, 126, 131)

: These wouldn't be true "grey scale" but the human eye wouldn't be able to
: distinguish these from a true grey in any case and the net result is that we
: have access to all of the "grey" we can use. Note, the eye would still be able
: to see a difference, but it would think that they were both grey.

It wouldn't matter--something to take into account in these cases are
brightnesses--a maximum of 256. No matter how many "off" colors you
have, in a greyscale image, they will fall under one of 256 categories in
a 24-bit system. No matter how you vary the color, it will end up being
one of 256 brightnesses.
Nope not quite...
Each color component have 256 levels of brightness, but the RGB
components are not equal in brightness (i think that the ratio is
about G=2R=4B or something like that, so by adding 0x000000 ->
0x010101 you can have eight levels in between each level of "true"
grey. This even worked on my Spectrum YEARS ago (using a B/W
TV-set...) to get a staggering 8 shades of grey ;)

As I feel concerned with this, I have to add, that we only made some tests using C-programms like factorising a special number or calculating pi to 1000 or 10'000 digits, nothing more. We didn't make a system-overall-performance-test.
Just to make this clear. It seems, that the i486 is a fast processor, but althought I'd never buy a PC. I still have some honor :-)

Maybe so, Apple is a bit sue-happy (?!?!)
Another option to cosider is the GEMul8r. It's a board for the PC which
has slots for TOSRoms. Works pretty well, actually. Althogh, it doesn't
support sound (yet) it's still under V1.0 (I think...)

Good luck.

It not so much how many different shades the eye can see but that the eye
is very adept at spotting the boundary between two shades, even if they
are very close. For example, if you have a 256 level grey scale and display
on the screen one shade and then close you eyes, update the whole screen to
the next level of shade and then open your eyes and see if you can see the
difference. I would be surprised if you could reliable tell if the screen
had changed shade. Now display half a screen with one shade of grey and the
other half of the screen with the next shade increment and you just maybe
able to spot the boundary - the eye is very good at that. If you can't
see the boundary try it with a 64 level grey scale and this experiment should
be a lot more clear cut. That is why so many colours are needed to get a
realistic image.

This month's Electronic Musician had a pretty positive review of the Falcon. It commented that the Falcon might help Atari regain some of the market share in music it has lost over the years. But the ST is still hanging in there - there's always ads for atari stuff and the occasional review.

>I know the built in Midi interface on the St's is'nt quite standard, but
>how about the falcon one? is it more powerful?

The ST MIDI interface is non-standard only in that the MIDI Out port also has a MIDI Thru signal, thereby saving the space of one 5-pin jack. As far as I know the Falcon MIDI port is identical.

Sorry to dissapoint you, man, but I'm a keyboardist and read a ton of keyboard mags. And I see more Mac stuff than anything else. I would say the Atari holds a distant third in professional music, slightly edging out the Amiga.

When you say, 'discern' do you mean:

a: Being able to tell the difference of a grey flashed upon a screen
from another grey flashed on the screen.

or

b: Being able to tell the difference between two shades of grey that
are adjacent.

?

(the contour detectors in the eyes are pretty sharp...)

3241. ICD HD Boot Up Problems

Newsgroup: comp.sys.atari.st
Date: 1993-02-23 23:26:25 UTC
From: berger@duterl.et.tudelft.nl
Message-ID: <1993Feb23.232625.22881@donau.et.tudelft.nl>
Source record: 209581

Hi,

I've got a SCSI HD with an ICD host adapter for conneting it to
my atari, but it doesn't work properly.

When I was using the ICD tools, many sense (11 & 17) error-messagess
appeared and one or two times this resulted in the loss of one file.

Now I'm using SCSI tools with Hushi, but still it doesn't work the
way it should be. When my system is cold it sometimes takes 10 minutes
to Boot up. Everytime while booting up, the sense messages appear, and
my computer hangs. But -when finaly- the desktop appears at my screen
further use is error-less.

Anyway, something is wrong with my HD, but what it is, no one can tell
me so far. Is there anyone who can tell me what the problem might be?
The warranty doesn't last forever, and I don't want my HD to die just
when the warranty has expired!

Please reply in private netmail, couse I can't keep up the extensive
flow of messages in all newsgroups.

Greetings, Jeroen.

3242. Information about a programmer.

Newsgroup: comp.sys.atari.st

I was wondering if anyone has heard of the programmer Roy Goldman? A few years ago, he "wrote a program for Atari PCs that allowed the computers to print in fonts and formats like those of more expensive computers." Also, "a magazine which features Atari computers now runs a monthly column dealing solely with his program, and Goldman says that 'almost everybody who owns an Atari computer uses my program.'" Supposedly, he "still receives letters from people who want him to modify and improve the program." I'm interested in any info about this program and what it is called. NOTE: All the excerpts were taken from the Feb. 23, 1993 "The Daily Californian," a school newspaper that serves UC Berkeley.

Black and white vision uses different receptors than color vision
does, so color discernment could be different from b&w.
I think this may be especially true in the middle levels.
At near black (and maybe near white), however, it all looks
the same to me! Color receptors are less sensitive, so dim color
light doesn't really register.

>is on a perfect power of 2 boundary, next thing I know I'll be the Terminator.

Well, it all depends. If you're talking just brightness (the V
in HSV), then a gamma ratio of 1.01 is indistinguishable. If you
work out the equation, the number of colors you need should be:

n = log(1/I0)/log(1.01).

I0 is a value that is dependent on what medium you look at.
1/I0 is the dynamic range of the medium. Here are some examples:

Dynamic range Number of intensities
monitors 50 - 200 400-530
photo slides 1000 700
newsprint 10 234

As we can see, anything over 9 bits of brightness is probably
not useful. Add color, then everything is thrown out.

The table was abbreviated from Foley, van Dam, et al., and the
book on the 1.01 figure is by Wyszecki and Stiles titled _Color
Science: Concepts and Methods, Quantitative Data and Formulae_
published by Wiley in 1982.

>maybe 20m or more CHEAP!!!

You might want to try rolling your own. It is very easy for the ST. You
need:

A host adaptor
A power supply
An enclosure
A SCSI drive

I recommend the ICD Host adaptor. It has (IMHO) the best software, which is
updated frequently (and available free). They also provide a very easy way
to add a battery backed up clock to your ST (if you don't have one already,
they can be bought with or without the clock). I also like ICD's because they
report any "sense codes" the drive communicates to the user. I have only
seen one ("read error with recover", induced by dropping something heavy on
the desk while the hard disk was reading), but I find it reassuring that
any weirdness at the device level is reported directly to me (it pops up in
the corner of the screen, by the way). Price is about $80 at last look.
Without the clock, you save $10. Order the SCSI connector cable whereever
you get the host adaptor, and make sure to ask for a dual drive one with a
red wire denoting pin one (to make the installation easier).

Power supplys are cheap. Just pick up an old XT power supply for ~$30 from computer shopper. If you can find a junked PC, you can get one for free.

Enclosures can also be cheap. You can buy one of those huge old style XT cases for about $30 from computer shopper. This will hold all the hard drives you will ever want! Buy a tower stand for $5 and stick it on the floor (the ICD cable is nice and long for this). You can also go all out and buy an enclosure which will fit under your monitor (mine houses 2 5.25" devices, has a front mounted lit power switch, mates perfectly with the ICD board, etc) with power supply for about $125. There are several places that sell these for the ST, two being Toad Computers and D&P Computer Supply. Email if you want their 1-800 numbers. Again, a junked PC is the absolute cheapest way to do this. If you can get ahold of grannys old IBM XT, you are in fat city. A nice side bonus is that the old PC motherboards make great wall hangings (big fat traces, lots of chuncky looking components). Old PC's are really easy to find, now that everyone is going to 80x86 machines.

Now, the SCSI drive. These can be bought from computer shopper. All you need is a bare SCSI device, no other boards or anything. The ICD host will work with just about anything, but there is a very large list of already tested drives that comes with the host adaptor (which I could probably email to you also). Drives are very cheap nowadays, and if you want to really save money you can get a refurb. Several of the refurb places will guarentee their drives for X number of years (X varies with the particular company), so they can really be the way to go.

Anyway, you will now have your hard disk. You bolt down the drive and host adaptor (you can drill some extra holes in the case, or use wire-ties or whatever), connect the two, plug in the power cords (the ICD comes with a little splitter which connects to a standard PC type power cord), hook up the DMA, and boot up. It is very simple, and is not easily botched up. You only need to pay attention to:

SCSI id jumpers set to some reasonable value
SCSI terminator pack plugged into the drive
SCSI connector from drive to DMA is right side up on both ends
Nothing wiggling around

The first two can be checked via the manual that will accompany the drive (make sure you ask for one, some places assume you already have one), usually a 1 page Xerox. The third can be verified by checking that the red wire side of the ribbon cable is near pin one (which is marked on the board either by a number or by a square solder hole instead of a round one). If the cable is in backwards, the red end will be at the other end of the connection (quite often it is pin 2 that is marked, but you only need to know which end of the connector the numbers start on, and match it with the red wire). These are the only two possibilities. You cannot mess up the power connections or the DMA connection (they won't go in wrong).

The reason you wanted a dual drive cable is so you can easily add another device in the future. You merely have to plug it into the other receptacle on the cable, remove the terminating resistor pack off the middle drive on

the cable (the one on the plug closer to the computer), and check to see that the SCSI id jumpers are set to two different numbers. Oh, by the way, the ICD supports the Syquest SQ555 (the 44mb removeable cartridge drive) without any special concerns. Since the Syquest is a SCSI device, you can hook one of these up just a easily as you could a regular fixed disk drive. These only cost about $320 bucks nowadays, with 44mb cartridges going for ~$60.

It really is easy, and there are plenty of computer tinkerers around to look over your shoulder and verify what you do. You can also use a setup consisting of a host adaptor, SCSI controller board, and ordinary PC type hard disks, but you add complexity to the system and lose performance this way. Straight SCSI is much cleaner, and usually much faster (SCSI devices have their controller boards "built in", comunicating with the SCSI standard).

If you do get a hard disk, you should immediately buy Neodesk 3 and the Universal Item Selector III. They will make life much nicer. Also, beware of buying too small a hard disk. Megabytes are like potato chips. I have a buddy with a 105mb quantum drive, a 320mb Hitachi, and a Syquest SQ555 with 6 cartridges all hooked to his ST, and he still complains about not having enough disk space! I have not yet gone that apeshit, but I think Mr. Visa might have to talk to Syquest Corp. pretty soon. Oh, notice the my friend above has three SCSI devices hooked to his ICD. This just requires a 3 plug cable. The ICD can support 8 SCSI devices, and you can hook up multiple host adaptors if you really need to (like if you get given a box of 10mb SCSI drives :-).

Please feel free to email questions. The above is IMHO, direct flames elsewhere.

In article <1993Feb23.181628.21826@apgea.army.mil> rcmerrit@apgea.army.mil (Robert C. Merritt <rcmerrit>) writes:
>
>I am looking for descriptions and opinions of the follwing games for the 7800.
>
>1. Alien Brigade

Basically like Operation Wolf. Does not work with the Light Gun, however.

>3. Jinks

Peculiar game indeed. You control a triangle, which is used as a paddle on a ball in a setup remotely similar to breakout. But there are walls on all sides; the ball cannot go by you. It can, however, go out of control, and end up where you don't want it to be. If the ball is destroyed, your game ends. The playfield scrolls horizontally, and is about 5 to 6 screens wide. There are four levels (screens), which you may visit in any order as many times as you wish, though they get harder with each visit.

>4. Midnight Mutants

Fun game! Something like the original Atari 2600 adventure. Fairly scripted, but it's fun to figure out. The manual provides a few hints and a crude map, but the game is in no way spoiled, the way "Nintendo Power" and the like would do. And of course, the graphics here are, well, pretty good.

>6. Planet Smashers

Excellent game (IMHO)! In the manual's own words, a "standard space shoot-em'-up"; scrolling space background like Galaga, but the enemies come in from all sides, and act individually. The game seems simple at first, but once you start to get far, you find out how complicated it can become.

>8. Dark Chambers

This is funny. It's Gauntlet ... sort of. I get the feeling that Atari Games was not willing to let Atari Corp. have Gauntlet itself; so this game is all the images from Gauntlet, but each does something different than it would in Gauntlet. Anyway, the game is still pretty similar. Lots of levels. Nice graphics. One or two players only.

>and the following are 7800 that I know what they are, but I need opinions
>on how good the Atari 7800 version is:
>
>1. Xenophobe. (I've spent big bucks on the arcade and rented the nintendo
> version. This is the one I must know about)

I played a lot of coin-op Xenophobe, and I like this version. Virtually all the aspects of the coin-op are there.

>4. Joust

Superb! Do not pass up the opportunity to get this!

>7. Dig Dug

Fair. Nice graphics and sound, very close to the original, but ... doesn't feel quite right to me.

>8. Deluxe Asteriods

Very nice. The asteroids look like they do on Blasteroids! Problem is, this game is hard. Not impossible, by any means, just hard. Of course, I was never any good at Asteroids, so my opinion should not be taken too seriously.

GEM no longer belongs to DRI (which itself has been acquired by
Novell). DRI turned GEM over to a company on the west coast, which
I believe was called Discus. They sold GEM, and some GEM apps for the
IBM.. Last time I checked, GEM for IBM went for about $39, and they
weren't updating the drivers.

3249. Quantum ProDrive LPS inside a MegaST4?

I'm considering adding a 3.5" 40Meg Quantum ProDrive LPS to my Mega ST4, internally.

Do any of you know if this "ProDrive" is compatible with ICD's Advantage Micro host adapter?

Are all Quantum's LPS drives called ProDrives?

Thanks ahead of time for any and all responses! :)

-Matt

Atari DSP chip sound quality!? Play a CD, it's better quality than
that! A lot quicker too!

the MIDI interface on the ST's IS quite standard, it will work on any
MIDI device as long as the software will accept it!

Already there are Simultaneous Sound & Video digitisers available
for the Falcon, and several of each to do just one. (D2D for example)

The Falcon IDE Hard-Drive is quite standard, if you have an IDE drive
that will fit in the case (2.5") then it will work!

These days, if you want to run a SCSI drive on the ST, you just need:/

SCSI Drive (Plus a box to stick it in, or it looks 'orrible)
SCSI Connector Cable
ICD-Link

The ICD-Link, just converts the ST's ASCI, into a SCSI, the general upshot of which is, you plug one end of the Link into the ST, and the other end into the connector cable, which is plugged into the Hard-Drive!

(You will also need the Power-Supply unit, otherwise it sort of won't go! 8-)

Also - (To the original poster as well), Yes Atari does (did) make Hard-Drives, they were slow, grotty and huge (size, not storage space), they also cost a fortune! Making your own, or buying a 3rd-party drive is a LOT cheaper!
(It is quite possible to put together a 60meg SCSI drive unit for the ST for around $300) - Using all brand-new parts!

How does it compare to GIFSHOW 1.2? It'll show most colours, and will let
me shrink a GIF so it can be saved into degas, spectrum, and a few others,
it works in all resolutions, except it has memory limtations on really
big GIFs...

I have a small program, which plays noise- and protracker mods via
ST-sound chip. It can be found (uuencoded and compressed with zoo 2.1)
in newsgroup 'comp.binaries.atari.st'.

Features:
-easy-to-use GEM user interface
-playroutine is by Griff, small modification by me
-good sound quality (17.1 Khz replay rate with 11 bits dynamics)
-works on ALL resolutions and screen refresh rates
-plays all protracker effects
-works on Atari ST/STe

Have fun with it!

Such ignorance.
The $150 cost of the card is addition to the cost of the PC (and you'll need
a 486DX2 with a large IDE drive as well to get the performance you'll need.
It'll come to a lot more than the Falcon.

Well well well. Here at uwe.ac.uk (Bristol, England) we have just got 16 TT's in (or was it 15?). I have also seen the man with the money with several booklets on Falcons. Our TT's will be Etherneted (soon!).
Why the hell doesnt MicroProse Formula 1 Grand Prix work on them (Frustration!)
Anyway, we have mainly Eizo flexiscans for TT hi rez (Pagestream 2.2 is god on these, nobody want to use a Mac, Pc or even a workstation when they see this!) and only a few colour multisyncs. BYE!

Just to add to the confusion a little, I know there's also a CPX out
there called "MiNT Prozesse" (or something like that - I think it *may*
be included in one of the german-CPX files at atari.archive,
but I'm not sure). This CPX seems to let you change process priorities
when running MiNT - sort of like doing a "re-nice" I suppose...

Well, ok the version of minesweeper that came with the falcon runs in a window under multiTOS, but the game is a really cr*p version of minesweeper - slow, doen't do all the things minesweeper should. The samples aren't to hot either....

>I think the only thing I've
>used PC GEM for is GemDraw. Is there even an Atari version of
>GemDraw?

GEM for the PC was created by Digital Research (of DR DOS 6 fame). DR is now owned by Novell (the LAN folks). Atari GEM was based on the original DR GEM before the Apple law suit. While (PC) GEM is apparently not actively marketed anymore, there are still some major packages available for it. (Incidently, the DR DOS GUI shell ViewMax operates and looks remarkably like the PC GEM desktop). Anyhow, programs which follow the GEM rules are data interchangeable between PCs and Ataris.

The IMG bit-mapped image format was created for PC GEM as was the (guess what?) GEM vector graphic metafile format.

So one can do the following (and I do it all the time because I use PC GEM at work).

Interchange files between:

1) GEM Draw on the PC and Easy-Draw on the ST
2) 1st Word Plus on the PC and 1st Word/ 1st Word+ on the ST

YMMV and degrees of compatibility vary by release level but basically PC IMG & GEM are the same as ST IMG & GEM for those programs that support this format. (Incidently GEM Paint on the PC creates IMG files, but I have never bothered to take them home and try them in Touch-Up.)

A major GEM Application for the PC (still) is the Xerox Ventura Publisher. Since I don't have it, I don't know about interchangability.

I gotta admit though, my 25 Mhz 386DX PC at work running GEM is extremely *fast* but is a pale imitation of my Atari STE. :-)

The sparc2st program can be used to convert sounds from .au to .snd and can be found on A.A, but you may need to convert them again with DigiEdit so you can actually listen to them. I quit using sparc2st because it really isn't that good. The problem I think is that it converts the .au files at the same sample rate that they were originally recorded at. I have Spectre GCR and use a much better program on the MAC that coverts to 11. something mhz, they always come out better than sparc2st files and then you can transvert the sounds to the ST side. I know this doesn't help non-Spectre GCR people, but if someone wanted to write a new converter, they might use the same method.

I believe the actual test is to place two squares of the subject material
onto a background of either solid black or white - whichever gives the best
contrast against the test material. Oh, the test areas are also seperated
by the background matrix. The human eye/brain is quite pathetic at dis-
tinguishing even tiny grey scales with this test. I guess the key is the
word "brain" since it is reinterpreting what the optic nerve is detecting.
I would guess that the eye on its own is much more sensitive!

>Gavin Ouckama
>ouckama@server.uwindsor.ca
>---

Well, everything I've heard/read seems to lead me to thing that the Atari Jaguar will be very much like the T-16 in that respect.
The TG-16 has an 8 bit main processor and a 16 bit graphic chip.

The Jaguar probably will have 2 68000 has it main "processor" and a 64 bit risc style chip for its graphics.
(source come from Game pro, Eletronic games, people who have emailed me and Prodgy but nothing is for certain)
Another story that haves several sources backing each other up is that game companys (mainly Eletronic arts) that have see it say its graphic ability matches that of 3DO (and may surpase it) and bets neo-geo and every other game system, hands down.
The base system is supposivly going to cost between $99 and $150.

To translate Ewald's response... ;-)

A .GEM file is a picture, and you can usually load these into Desktop
Publishing programs or word processors. They're made up of commands
like "draw a line from A to B" or "draw a circle X wide, starting at Y".
When a program loads the .GEM file, it reads through the commands, and
draws the picture.

A very few drawing programs can load/save GEM files. Ventura Publisher
on the PC uses GEM files as well.

I'm pretty sure most of the overlay brain-damage is built into DOS; I
certainly wouldn't want to try getting overlays working for TOS. You
need a special compiler, a special linker, and probably special
libraries to do the overlay stuff, so it'd be a _major_ hassle.

Now, if we all had '030s and virtual memory...

Everyone really should upgrade their RAM though... It's fairly cheap
(especially if you have a knowledgable friend who can do it), and VERY
useful for everything...

Look on atari.archive.umich.edu for Dave Baggett's piture formats
document; I'm pretty sure it has a description of the ComputerEyes RAW
format.

If Atari had a clue, they would've gotten someone to make a VME board
version of the Lynx development hardware. Currently, it only runs on an
Amiga (that's right; Atari has Amigas inhouse to create Lynx games...
talk about helping your enemies bury you...).

Just another example of Atari's stunning business practices.

This isn't necessarily such a bad thing... After all, the Multi-Dungeon
bits and the new vision system are essentially the only "new" things in
NetHack 3.1; the multi-dungeon addition is a great thing, since it adds
extra quests for each character class.

I don't believe I've seen that one! I have Fast-GIF, View-GIF, DMJ-GIF,
M-GIF, Photochrome, GIF2SPC, GIF2RAW!

Out of the above, View-GIF, and Photochrome are the best!

3289. Re: How Many Colours is true ColoUr?

Newsgroup: comp.sys.atari.st
Date: 1993-02-24 19:25:39 UTC
From: rossin@hpfcso.FC.HP.COM
Message-ID: <7340123@hpfcso.FC.HP.COM>
Source record: 209678

Don't forget that your monitor is not a linear device. True color (8,8,8) still looks like crap when drawing anti-aliased primitives without throwing the output though a look up table to correct the monitors nonlinearities. Whenever filtering operations are performed (ray tracing code does this alot) to get rid of jagged edges, the output assumes that you are displaying on a linear device. This is why Brooktree RAMDACs for true color (24-bit) systems still have RAM for a look up table. This way, the driver code can download a gamma corrected color map to make the framebuffer data appear to be linear. You may have 8-bits per color in the frame buffer but by the time the range has been made linear you will only have 200 or so intensities per color.

Check out "Computer Graphics: Principles and Practice"
Foley, van Dam, Feiner and Huges. Section 13.1.1

Trust me, I've seen the difference on our 24-plane graphics heads. You must have the look up table even on true color or you are playing with crap. I hope that Atari did not screw up their 16-bit "true color" by forgetting to allow the user to place a color map on the output. If they did not do it, code to draw anti-aliased vectors will still have jagged edges. How are the colors organized?

5 bits red, 6 bits green ,5 bits blue
5 bits red, 5 bits green ,5 bits blue, 1 bit overlay (or attribute)

If it is the later, they should have a 32 element by 8-bit table on each of red, green and blue. This way a gamma corrected colormap can be downloaded and the 5-bit range will really have 32 linearly spaced intensity points.

Ted who rambles on.

There's the problem....

Any reasons why it is wrong information!? IT is quite possible to get
1280*400 out of a Falcon (with an extra card, but it's such a horrible
resolution anyway, with most stuff looking like it's been stepped on)

And, gee, it doesn't flicker either! (Even before it's release, a patch
to run the thing in 78Hz, which WORKS!)

Ever heard of Overscan!?
The Falcon also has the famous Amoeba Interlace & Line-doubling, to get
that pretty flickery effect (which, doesn't flicker on the Falcon in
78Hz...) As was said:/

> |> You don't need Hardware to do that!
> |> 640*1440 or 832*600 without HW and 1024*1440 with HW

The 486-AT EMulator for the Falcon, is available 'RSN' (aka, between 1 week, and 1 year), by Compo, creators of the AT-Speed C-16 unit!

It should be ready for release by mid-march I'd say, complete with full color VGA graphics, and running at probably aroun]d 3p around 33Mhz!

Even rumors about telling the PC it has a SB-Pro sound card built in, so you can get something better than 'bleep, bing' out of the sound! (I find this unlikely though, I can't think why it'd be terribly difficult using the DSP however, going by some of the things supposedly impossible that people have done in the past!)

The "MiNT Prozesse" CPX is the PS program (By A.Pratt?). It is _much_
nicer than "renice" as it provides you with all running processes and a nice
graphical interface for selecing/modifiying the nice values of each. Also, it
is like having "kill" added to it because you can send lots of signals
(SIGTERM, SIGSTOP, etc.) to any of the runing processes incase it hangs (which
is real nice if it is your shell that just hung). It also tells you how much
memory each process is using! A _very_ must have program if you have MiNT!

>ADATs. Problem is an Alesis ADAT is 1.5 to 3 times more expensive than a
>FALCON.

You fail to include weveral things in you analysis.

1. It's got one DSP and a 16MHz '030.

I have done research in digital audio and while a 56K dsp can handle getting
8 tracks of data you have to do some weird things to do it. That is the
software and hardware become real strange where the data has to be extensively
multiplexed and you have to get the data back by shifting bits around. This
is for 4 track 16 bit sound. TO get the other 4 tracks requires you run the
bit rate clock for the 56K at an 88K sampling rate and more shifting of bits
around.

2. You don't get better than ADAT or Tascam DA-88 sampling rates. Even if you
did it would still have to be sent to the CD mastering house as 44.1K sound.
You are better off recording at 44.1K than at a higher rate and using sample
rate conversion. Sample rate conversion is expensive in computer time
and for it to sound good linear interpolation won't do. This means lots
of disk
space to get it done.

3. It's not cheaper than ADAT or DA-88 when you include the disk space and
backup tape drive you are going to need to store those 8 track. Remember
10 MB/minute times 4 is 40 MB per minute. A 5 minute song needs 200 MB
of space. IF you want to edit add another 200 or so to store temporary
files. Also a good tape backup unit costs close to $1200.

4. I guess you could include this in the above but you better have a
fast hard drive besides being big.

>In case you don't know, the Alesis ADAT is meant to be the next STEP FORWARD

>
>What? at 50KHz, 16 bit, 8 channels at a time? I doubt it.

You are correct CD qulity A/D and D/a cannot be had for $150 on those
platforms.

>It's built in to the FALCON, it's not an add on. It means you can write

Wrong, out of the box you cannot record 8 tracks at a time. You need external
hardware so add the price of that. Also CD and DAT sampling rates, ie.
44.1K and 48K need external hardware because the Falcon doesn't support
those rates internally. See the review in a couple of the music rags.

>software and know that the hardware is there, not having to rely on someone
>putting the correct card in a slot and set the right jumpers...jeez.

Currently there is no 8-track software so unless someone writes it you still
can't do 8-tracks.

>>
>>>Just wait and see after the big MIDI messe in Germany before you say
>>>anything else I'll bet the response will be enormous.
>>

>heard one,
>and I know it's good, jsut wish I had the cash.

Actually with the right software the Falcon is a synth. Quite a few synths
and samplers use 56K DSP chips. Also note that you can have it behave
like a sample playback unit, wave table synth, or regualr FM synth, with
the right software.

>
>Besides, I don't want to use the FALCON to be a synthesiser (which is what

> Poster by OXFAM.

One more thing the AD/64X for the Falcon is the same as the one used for the NeXT since the DSP port is the same. You can also hack a cable to get DigiDesign hardware to work. All of that is expensive.

I designed a box with AES/EBU, S/PDIF, and 64 times oversampling for the NeXT as part of my MSEE research project. The design could be used on a Falcon. It will also do a couple of more things lik strip SCMS along with letting you route data from 1 DAT/CD player to the Falcon and a second DAT at the same time.

How many people would be interested in getting a copy of the schematic? I don't have a PC board layout but for the right price I could do one. Since I only built 2 of the units I used wire wrap.

The only thing is I would need at least one person in the S.F. Bay Area when they get a Falcon to be the test bed for any mods I'd have to do to the design that would be specific to the Falcon.

It may be that the program is having trouble handling the Yamaha's
"Active Sense" messages that it sends constantly (at least my Yamaha
keyboards do). This is a single byte of FE (hex) sent every so many
milliseconds to let connected devices know it's still there. If the
PSS 788 has any ability to turn this off, try that. If not, maybe some type
of MIDI data filter is needed? Sorry I can't help more.

Regards,
Doug Sr.

It's the standard GEM file extension for a metafile. It's a device
independant graphics file. Most DTP packages should be able to read
it fine. Some art packages will too.

Hyperdraw or Easydraw will definitely read it.

In the UK, this can be bought for 80GBP. These prices seem a bit excessive.

I understand Atari now use it as their standard compiler for inhouse
development which I suppose also includes TOS.

Hisoft are in the process of recompiling stuff they have bought from
other developers such as K-Spread 4. The newer version is said to be much
more compact and a lot faster.

I bought my current hard drive configuration second hand, all ready to go. I have a BMS host adaptor and an Adaptec 4000 SCSI->MFM adaptor. I want to add a 2nd drive. The current drive is an old Wren I. The Adaptec is capable of supporting the 2nd drive. I will require a disk with a 20 pin command port and a 34 pin data port. Is it possible to find such old dinosaur drives yet? Would CompUSA type stores carry them, or is everything SCSI now? Also, is 20 pin ribbon cable available readily?

Organization: ASTRAsoft, Stoke-On-Trent England.
Lines: 98
Nntp-Posting-Host: jw9

No 'Approved: tale@uunet.uu.net... Invalid CFV

This isn't a good start. CFV's are posted by Dave Lawrence and posted to
certain specific groups. IF you have already submitted this message to
him and have decided to 'jump the gun' and post it yourself you have
invalidated ANY votes you may receive before the valid posting from the
moderator hits the net. In effect, you will have tainted the vote even
before it really began.

I'm against this proposed group, no secret. BUT I'd rather see it
defeated in a valid vote, not because someone screwed up the CFV
process.

Go to your room. You do NOT get a free cooky. :(

The eye ability to diferentiate colors is logarithmic. Therefore the closer
together the colors are, the more you can see. Your eye can see fewer colors
if your eye has to see wide ranging colors in the same picture (eg. a picture
with lots of red and blue) but a picture that is predominatly one color, a
grey scay for example, the eye can see a far greater range of colors.

I've seen the literature on hooking MultiSync monitors to the ST.
What about going the other way? Is it possible to hook an SM124
to an IBM-PC clone? What has to be done to accomplish this?

JJ0J>
JJ0J>Anyone had similar experiences? My friend has a micro-SCSI adaptor
JJ0J>and a Segate drive.

I have had such an experience when I tried to install a big (read and
write) cache with 5.6.0 and run a file-benchmark (writes 1000 files,
then deletes them, only 1 file open at a time).

I am now using 6.0.7 without troubles (but I have not repeated the test -
took a whole afternoon to restore the partition :-()
BTW: ICD damaged another partition than the one the test was run on !

I have heard that ICD 6.0.x can cause problems if you simply copy it onto
the HD and do not use HDUTIL to install it !

3311. Problems with Hermes

Newsgroup: comp.sys.atari.st
Date: 1993-02-25 04:00:47 UTC
From: coonstot@quads.uchicago.edu
Message-ID: <1993Feb25.040047.21290@midway.uchicago.edu>
Source record: 209501

I have recently d/led a copy of Hermes 1.04b. I have
installed it. I have changed the passwdfile, config.sys, paths,
spaths, etc. However, it doesn't work.

Usually it just locks up.(gus, login, and a number of other programs).
If I am lucky, when it locks up, it will tell me that I am
out of system memory and that I should run the folderxxx program.
However, I have a 4meg STe and do not see why this should be necessary
In fact, I think folderxxx causes trouble for my STe.

I am new to uucp and I may not have set this up properly. But
I have no clue as to why it would lock up. In addition, all of
the manuals(or most of them anyway) are in German. Are there
English docs available? Could someone give me a hand in setting
this up via email? or let me know what they think could be wrong?

Thanks,

Charles O. Onstott, III

>word "brain" since it is reinterpreting what the optic nerve is detecting.
>I would guess that the eye on its own is much more sensitive!
>--

The only "fair" test is the adjacent bordering test where the two
colors actually touch each other. When two colors are separated, the
brain can easily process them to both be the same color. Your brain takes
a lot of factors into consideration when determining colors. Among these
include lighting. For example, if a car has the shadow of a tree lying
across its surface, you still perceive the entire car as being the same
color. The area with the shadow is processed as being the same color as
the area without a shadow (although you of course perceive the shadow).
Also the way your eyes work, the brain is capable of detecting changes
on rigid outlines better than on highly patterned objects. Part of the
reason for this is that your eyes actually "jitter" slightly all the time
and there is a "persistence" factor in imaging.

3314. Help with old MFM drives

Newsgroup: comp.sys.atari.st
Date: 1993-02-25 05:15:07 UTC
From: skolodzieski@vaxc.stevens-tech.edu
Message-ID: <1993Feb25.001507.1@vaxc.stevens-tech.edu>
Source record: 209504
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

I had to take my SCSI drives off my ST as they where needed for a
new system, so I put my OLD SH204 drive back on my ST. The SH204 is a 20 meg
MFM drive by Tandon, I am using the Adaptec 4000 MFM--SCSI controller that
came with the SH204 along with the ATARI SCSI--ASCI board that also came with
the original drive. Now the question, I have a spare Seagate 225 MFM drive
sitting on my kithen table, what would be needed (and what do I have to do)
to add this drive to my system? Can the Adaptec card handle 2 MFM drives?
I heard from ICD that the Tandon drives in the SH204's had a hardware bug
that caused them to respond on all luns when queried? would this complicate
the issue severly? Sorry if this is simple but I do not really no much about
MFM technology.

please reply to:

scott@dmi.stevens-tech.edu

-or-

scott@sparc1.stevens-tech.edu

Thanks again,
Scott Kolodzieski.

3315. I've got a SLM605 ... now what?

Newsgroup: comp.sys.atari.st
Date: 1993-02-25 05:47:46 UTC
From: baffoni@phakt.usc.edu
Message-ID: <1mhmi2INNcpu@phakt.usc.edu>
Source record: 209505

Hi Folks,

I just got a SLM605 from a fellow netter (Yea!), but he couldn't find the diablo disks that came with it until after he had already shipped the printer (boo). So being the resourceful person that I am, I downloaded lazerbrain and tried to get it working, but only managed partial success. First I should list my hardware: TT, TOS3.06, 4MBSTram, Color, MiNT installed (but can be kept from loading by holding the right shift key).

I followed the instructions: I put lazbrain.acc in the root and rebooted. One thing I noticed right away - it didn't like TTmed, not one little bit. Ok, booted into SThigh, alright no problem. I set buffer to 500k, loaded the font that came with it and pressed exit.

I could do a alt-help and get a printout of the screen, no problem, except that it had these blank lines in it so I remember the docs said about setting the graphics to noninterlaced, so I double-clicked on the intrlc.prt file, and selected print. Well, after waiting a few minutes, it says that the printer is not accepting data. I tried all the other files. No luck. I thought maybe something was wrong with my configuration, so I dropped the lazbrain.bat into the root, edited it so that it pointed to the font and had a 500kbuffer instead of 200k and then restarted (and saved the desktop so that it would come up in SThigh. It booted fine, but any time I tried to pull up a menu, the output would messup royally, and if I tried to switch resolutions, the machine would bomb then lockup.

So, is lazbrain incompatible with the TT? Are there special configs I should be aware of? Is there something better than lazbrain (circa 89) out there?

Thanks for any and all help concerning this!!

-MikeB

Yeah, have you even been in europe? All the magz
in N.A. are this and all the magz in europe are
that. Have you been smoking pot lately. Why don't
you take a vacation for a couple of years. Maybe
to europe. As far as I know there are lots PC magz
some Mac magz, lots of Amiga Magz and there are
many ST magz too. So stop smoking and get a
vacation, OK.

>Also, has anyone managed to hook an SLM up to a PC? My friend wants to
>print some stuff from MS Word.

AS I understand it, there is no way to connect the SLM804 to a PC.
One, it uses DMA, not a prallel port. And I think that if even one
were to hack a SCSI to ACSI interface. (I don't think SCSI hostr
adaptors work backwards) the problems is that Atari laser printers
have no memory, they use the computer's memory.

3323. FTP site for kermit 5A(188) ST binary?

Newsgroup: comp.sys.atari.st
Date: 1993-02-25 09:12:35 UTC
From: dick@ahwau.ahold.nl
Message-ID: <C2zyx1.CvM@ahwau.ahold.nl>
Source record: 209513

Does anybody know an FTP site with the kermit 5A(188) ST binary?

3324. HARD DRIVE

Newsgroup: comp.sys.atari.st
Date: 1993-02-25 09:39:00 UTC
From: craig.dunn@almac.co.uk
Message-ID: <6379.723.uupcb@almac.co.uk>
Source record: 209514

Hi again.

I've got an STE and have just bought a cheap 400Meg IBM SCSI hard drive. Unfortunately the Hard drive doesn't seem to work. ANy Ideas why? The drive is completely encased apart from the back. At the back is the power points and the Hard Drive cabling. There is a set of 10 pins at the back for jumpers to be set on. Any Ideas to what jumpers need to be set???

cheers
Craig

>

In fact, both modes are available on the Falcon. You can have 65536 colors
simultaneously (5r+6g+5b) or 32768 (5r+5b+5b + 1 overlay). There is a pin
on the video port labeled the "overlay pin," which I presume goes high any
time the overlay bit is set for a particular pixel. This seems like it
would make genlocking really trivial in both hardware and software regards
(there is also an external sync input on the video connector). A low cost
genlock/overlay device would be a useful tool for simple video editing and
titling (well I guess a high cost one would be pretty neat too, but less
available... :-)

3327. ICD problems with SST

Newsgroup: comp.sys.atari.st
Date: 1993-02-25 10:57:25 UTC
From: lahtinen@gideon.fmi.fi
Message-ID: <lahtinen.730637845@gideon>
Source record: 209518

I have now my SST working but there is a big problem with
the hard disk. I am using ICD Advantage with ICDboot 6.0.7,
there is 2 HD's and the ICD Tape-unit. I have tried many
different configurations with terminators, but no luck.
I think the problem is the SCSI cable it is now about 4 feet
long.

Just now it is constantly hanging the desktop when I try to
access DA's (XCONTROL?). Does anyone know how I could improve
the host adapter so that it could be this long as I really
need quite long cable in my tower.

Writing with WordPlus and being asked for WordPerfect text?
Can't read WordPerfect documents on your Atari?

I've a conversion program WordPlus <-> WordPerfect 5.
Text only, no graphics.

3329. First Falcon breakdown?

Newsgroup: comp.sys.atari.st
Date: 1993-02-25 11:14:50 UTC
From: kgrubb@cee.hw.ac.uk
Message-ID: <1993Feb25.111450.25148@cs.hw.ac.uk>
Source record: 209519

Well this is one claim to fame that I would prefer not to have! My Falcon has had to be sent back to ATARI UK to be fixed, the hard drive controler card gave up the ghost yesterday. I've only had the beastie two months, well I admit two well used months. I only hope ATARI UK get it fixed in double quick time!!

Has anyone else had their Falcons crash landing on them? BTW the dealer I got my Falcon from recieved another batch today, but before you all email me asking where he is, don't - they are all spoken for! Roll on march 24th!@!

Kevin.

3330. Turbo C... does it still exist?

Newsgroup: comp.sys.atari.st
Date: 1993-02-25 11:32:08 UTC
From: baumer@cs.utwente.nl
Message-ID: <1993Feb25.113208.26737@cs.utwente.nl>

3331. Help me to Compile C progs

Newsgroup: comp.sys.atari.st
Date: 1993-02-25 12:07:16 UTC
From: grillo@flash.ATC.Olivetti.Com
Message-ID: <58113@olivea.atc.olivetti.com>
Source record: 209521

Hi there,

I have two little program written in C that I need to
compile, but since I have no C environment on my ST
(and I'm totally unexperienced with C!!)
I'm asking if some kind soul could do it for me....

follow the included sources (samlabel.c and samprint.c)

Thanks a looooot!!!
Savino

|
|I have had such an experience when I tried to install a big (read and
|write) cache with 5.6.0 and run a file-benchmark (writes 1000 files,
|then deletes them, only 1 file open at a time).
|
|I am now using 6.0.7 without troubles (but I have not repeated the test -
|took a whole afternoon to restore the partition :-()
|BTW: ICD damaged another partition than the one the test was run on !
|
|I have heard that ICD 6.0.x can cause problems if you simply copy it onto
|the HD and do not use HDUTIL to install it !
|
Hmm, I'm still waiting for my hard disk to be erased :-) and yet I'm using
6.0.6. Also haven't had problems with 5.3. But I have had problems
when I bought my (Maxtor) scsi drive, because it interfered with the reset line
of the 68000. My disk was trashed about every week for a while, until
someone discovered that a small capacitor on that reset line was required.
Since then the disk is really happy.

Marc

|>
|> Feekzoid

From what I've read and from the documentation files with the overscan program the OverScan hardware mod is incompatible with STE hardware and can only be fitted to pre STE models.

(Overscan increases in number of pixels per row, and the number of rows of pixels, generated by the computer (I think !) - a feature the STE doesn't have.)

From: hoyled@cs.man.ac.uk
Message-ID: <hoyled.730646392@cs.man.ac.uk>
Source record: 209524

Does anyone know of a PD juggling tutorial program for the 520stfm.
I only use three balls at the moment so nothing fancy is needed.
Anything with animation and text would be useful.

Duncan.

Hey ... you can't get this to work either? Hmm. I thought it was
just me. I figured it might be 'casue (sory about typos... for
some reason this terminal doesn't have a backspace...) I run in
50 Hz (UK) rather than 60. I've tried it on TOS 1.0 and 1.4, with
1 Mb and 4 Mb of memory, off floppy and hard drives. At this point
I gacve up... any ideas, anyonme? (Again, sorry fot the typos... ;)

Tim.

Hello Atarians,

I have some original 1040ST equipment I would like to sell:

Color Monitor $100
Mono Monitor $100
20 MB hard disk $150
Monitor Master Switch $20

I also have some software:
Mark Williams C-Compiler $50
Lattice C-Compiler $30
NeoDesk $20

Cards $10
Star Fighters $10
Rogue $5

If your interested send me a message or call me at home: 708-358-4315.

Bob

> dillon@esial3.u-nancy.fr

CAD-3D is/was the first 3 dimensional modeling program written for the ST. It's not a drafting program as some people might guess from its name. Version 2 was capable of making 3-d "movies". There was a variety of other programs written to aid in the creation of CAD-3D objects and movies. It was released through Antic Publishing, which, unfortuately, is out of business. To the best of my knowledge it's not available through ftp, bbs, or comercial sevice. The only real chance of getting a copy is if a discount resaler has a copy or someone is willing to sell their own copy.

If your looking for more recent software that will do basically the same thing take a look a Lexicor's set of graphic design software.

-Steve Kinneberg

I am searching a easy-to-use formula editor that enables me to put formulas of different complexity into a SCRIPT2 text. I don't want to use TeX, due to its programmer's style of writing. A IMG output would do nicely!
Anybody any ideas, I read about one in a german magazine, but I don't recall its name.
Thanx in advance!

Care for my $.02 ??? Several years ago I had possession of a demo program from BROOKTREE that came with a plug in tower which replaced the INMOS DAC in your PC. This allowed one to compare an 18 bit palette with a 24 bit palette (hardware switch on the tower). The demo screen contained sets of red, green, and blue color bars, 64 horizontal bars increasing in luminance to the right in 18 bit mode, and 256 horizontal bars in 24 bit mode. To my eyes in 18 bit mode the blue bars were barely distinguishable, the some of the red bars were noticeably different, and the boundaries between all of the green bars were noticeably distinguishable. In 24 bit mode only some of the green bars were distinguishable, the red and blue bars looked like a continuously variable spectrum. This was on a fairly decent monitor (NEC MULTISYNC II), so your results may be better on a monitor with less bandwidth. Also since that time I've seen some ray-tracings of speres and the like, and I would have to say that green spheres look gruesome in with only 64 shades (dithering might help here). Overall I would estimate

that about 7 bits of blue, 8 bits of red, and 9 bits of green would be about right for critical applications. Of course there may be eyes out there that are more discerning, keep in mind the above represents a sample of one.

The patch discs modift the original master discs. The first thing the patch programs do is to make sure the master discs have not been modified (apart from registering of course). If the discs have been modified then you cannot continue.

There are differences between UK and USA versions (The date format for a start) and this means a different patch program is needed for a start.

I find this difficult to believe. The atari spokesman from the show said to me that machines were being shipped from the beginning of march but as Gaestiner and Silica have almost a 6000 machine backlog in total if you have not already ordered a machine you are unlikly to get one until the end of march.

Sigh. THE DSP IS NOT A SOUND CHIP!!!!!!!! Repeat after me, THE DSP IS NOT
A SOUND CHIP!!!!!!

How many times are we going to have to put up with this? I see demos on
local BBSes attributing the quality of every piece of new Falcon software
to the damn DSP chip. Arghhh. The Falcon has 16-bit audio chips that are
completely separate from the DSP! Get a clue. I doubt there's much DSP
software around at all right now.

Message-ID: <16B80A9BC.C556212@mizzou1.missouri.edu>
Source record: 209537

I got ICD 6.0.6 from ftp. (sorry if I broke some licensing, but I do own
an ICD drive...) At any rate, I installed it after renaming my old ICDBOOT.
So far I have no complaints, I just followed the documentation.
So, is 6.0.7 that much better? Will it appear on the net, or should I call
ICD? (what would be the number, anyways?)
Just thought I'd add my 1.5 cents to the discussion...

>
>Are there many ftp sites for the ST around?

>Please could someone e-mail a list of these sites?

I used to update a list of FTP sites and post it to
comp.sys.atari.st when I had access to the Internet. It was held on
atari.archive in the the Admin directory as Other.ftp.sites if I
remeber correctly, since loosing my access i have been unable to
update it. It isn't a full list, I only showed those major sites with
a brief description of their contents. You will probably find that
someone has since done a more exhaustive survey. However now that I
am back on comp.sys.atari.st I will start again and try and
recompile my old list, unless someone has already done that. Many
lists I found just contained site names of which most where defunct
long ago.

I'll see what I can do over the next couple of months.

Chris Wood - GST, St. Ives, Cambs.
CWOOD@GST-soft.demon.co.uk

P.S. This is my first attempt at posting via TP I hope it comes out
ok. I'll get a sig sorted out hopefully.

Coming this summer in two multimedia Macs ($2500 and $5500). They can do 16-bit sound, digitize live video (with sound), use the video as a background pic, put the video in a window, and some more tricks. The soft ware that comes with it is supposedly finished Casper (Speaker Independent Voice Recog), a Text-to-speech device which smooths out the words so they sound more human-like, and some of the Kaleida multimedia stuff (have to really read the Macweek article to find out what all is in this...)

But from the sounds of the article, I'm not sure that there will be an add on card for the other macs, if there is it won't have the full functionality of the new Macs (Cyclone and Tempest).

(The Amiga with the same DSP is due out by summer too.....)

Sorry...but you *asked*.

The VGA standard, as defined by IBM (who invented it), has 2 high-end modes:
320x200x256x
320x200x256c
and 640x480x16c
It can also handle the olderstandards (CGA,EGA,etc., but not Hercules),
and does have some "secret" modes which you can blink in to, if you
know what you're doing, like 320x400x256c, but they are considered
non-standard. SVGA is anything beyond VGA, which includes 640x480x256c

3362. Will somebody please say something USEFUL! (sp?)

ATARI Base lately:
ATARI..bash, bash bash...
AMIGA..bash, bash, bash...
MAC..bash, bash, bash...
IBM..bash, bash, bash...

Average Net News Reader Lately:

Zzzzzzzzzz......

Time to stop whining about who's got the better computer and
to stop making pot shots at people who aren't really there
to defend themselves (yep, it sure takes guts to POST insults) and
to stop wasting bandwidth.

I hate to sound like "your mother" but this sort of stuff is really
starting to get silly. So could we all get to some REAL discussions.
Not superficial things like arguing over the meaning of TrueColor or
true color or tRuEcOlouR...etc.

For those who really need to keep doing this...HEY LOOK! Isn't that
the Alt.flame.flame.flame base!!! Go get 'em!!

And to whoever moderates this base (or are alts the unmoderated ones)
could you PLEASE not cross post from any base that contains the name of
any other computer? If you continue to cross post you are BEGGING to get
the heaps of TRASH that we've had to wade through for the last, oh, I'd
say, about, two months. If you really want to do any cross posting from
other computers bases it should be done on .advocacy bases ONLY. That
way we can keep a lid on the amount of arguments in the REAL nets down
to a minimum.

I think my "k" key is going to break off!

P.S. If you support me. Please don't send mail. I appreciate it but my
mailbox is kind of clogged. Thanks for the support though!

Tip:
If you think somebody wants to start an argument than just ignore it.
Just let their message float by. Message wars always start out by one
"innocent" retort. Walk away and have a cool drink. If we all pitch in
we can make this base free from trash.

Thanks everyone!

J> To be honest, I wish they would come out with a TT version of
J> Photochrome. Can you think of how cool it would be to see
J> 640x480x19kcolors

Impossible .. PhotoChrome uses the "SyncLock" method to get more colours on screen .. and from what I've learned when using that programming teq is that it *NEEDS* an *EXACT* speed ... no processor with a cache can "SyncLock" using the teq that's in use now .. (I tried on my AdSpeed:ed STE..)

However, by shutting down ALL caches'n'stuff it *SHOULD* be possible .. and on a fast machine like the TT I believe that it would be able to put out those 32768 colours it CAN get, on almost any spot of the screen.

(The term "SyncLock" means that you're locking the raster to the processor, meaning that you can control the EXACT spots on the screen on where to change the colour, due to the speed (?) of a stock ST you can only change colour each 8:th pixel. Most packages only switch each 10:th or 16:th though ..)

Thanks. I'm a member of Synchron Assembly, though I haven't done any
of the programming on Audio Sculpture.

What version are you using? We never got it out for sale as the
companies f*cked up .. we don't care anymore if people are using
cracked version, so go ahead if you find one. (I have v1.4 (the
newest) up on my BBS .. cracked by The Replicants .. ;)

Atari France said something about "would you like to do a Falcon
version of A:S" so ... the guys who did A:S haven't decided that yet
..

Please try to get v1.4 as it is *MUCH* better than *ANY* othe tracker.

Sorry? There are about 2 ST mags available in the UK, and about 8 - 10 Amiga
mags. (Very few Mac, and slightly more PC mags though.)

Yeah, me too! When I get the Falcon, I'd like to reeely see what it can do.
Well, that and I want to show it off too! :)
Are there any good demo's around for the bird? I can't get on to either
a.a. or wuarchive, so I don't know if there's anything good on for the Falcon.
If there are any good demo's there, please inform. Thanx.

According to "The Story of English" (a series I saw on TV a few years back), there was no concept of correct, or standardised, spelling, until the advent of the printing press. The early printers had to decide which version of "English" to use, choosing spellings as they saw fit. The difference between American and British usage comes about because what's now the US was settled and somewhat established by the time the printed word "solidified" spellings.

On a related note, someone I know who was studying language pointed out that people shouldn't have complained about Kevin Costner's Robin Hood speaking with an American accent, since it's probably closer to how English in the Middle Ages sounded than a modern English accent is. Interesting, eh? A bit off-topic, though.

This is the little addition to the Amiga that allowed it to do so well in the video market. It's a pity Atari have left it about 10 years too late...

Well, I called up New World Computing (1-800-325-8898 for orders [though I used it as an info-line] and 1-818-999-0607 for anything else) today.

I asked the woman on the other end of the line about a version for the Atari ST... There were no plans for such a version. :(

I do have to give her credit though... at least she didn't say, "I thought Atari was out of business!?!".

I suggest that anybody who is interested in this game (as I most certainly am!) call New World Computing and ask about an ST version. If enough people ask, maybe they will change their minds.

BTW, here is some info from an ad in Compute! Magazine. (No flames for using an ad as a test of the game's worthiness, please!)

Network and Modem Compatible
Super VGA Graphics
Advanced Scenario Editor
Superior Computer A.I.
Digitized Sound Effects
Various Difficulty Settings
Completely Re-Playable

By Mark Baldwin and Bob Rakosky

The "screen shots" look great! It looks like there are new terrain types. Grass/Plains (not new :), Desert (maybe hills as they are surrounding a...), Mountain, and Sea (not new either, unless you're the type who likes to play on an all land map). An info box with a picture of a tank (sorry... army ;) is covering up most of the rest, but I see pink/red (object/background colors) ships, light blue/blue armies, and yellow/brown armies and ships.

The other screen has more of the same types of ships and a drop down menu for resolution selection. I can make out:
320x200 (256 colors),
640x200 (16 colors),
640x350 (16 colors),
640x480 (16 colors),
640x200 (256 colors),
and one more that looks like 600x600 (16 colors).

I would think the Falcon and/or TT could do all of those with no problems!

This was brought to you by,
Kenneth Love

I am trying to print a chart with Opus 2.31.

I have G+plus installed with a bunch of fonts, and production of the chart goes with out error. However when I try to print or save the chart os a MetaFile it goes to the disk with GDOS fonts on it and searches for a file called GEM.SYS. I don't have a file called GEM.SYS on ANY disk -- not the original G+PLUS disk, nowhere.

What do I do?!?!?!? Please help!

Any ST can use SIMM's, but the pre STE machines need a bit of re-wiring to do it! (Perfectly possible though).

If you buy a Mega STE, or 1040STE, SIMM's will work fine! (Presuming they are the correct type - someone else should be able to tell what type, as I can't remember)

Yeah, sparc2st is crap. I ought to know, I wrote it. :)

>The problem I think is that it converts the .au files at the same sample
>rate that they were originally recorded at.

That's not the main problem, actually. The main problem, sound
quality-wise is that it uses table lookup to convert the uLaw values to
8-bit samples, and the table sucks. I worked on getting it right for
about a week and then gave up. If someone could point me to source for
a better converter I'd be happy to make an ST specific version.

>Does anyone know of a PD juggling tutorial program for the 520stfm.
>I only use three balls at the moment so nothing fancy is needed.
>Anything with animation and text would be useful.

I have a juggling program on my ST, but it's not a tutorial.
It runs in low-res; a couple of bitmapped hands juggle variously-
colored balls. Input is my own klugy juggling notation, almost
but not quite completely different from site-swap. I have files
for 3-, 5-, and 7-ball cascades, 3-ball reverse cascade and half-
shower, and a 3-ball Mills' Mess.

The code still needs some work, but I haven't touched it in over
a year. If there's interest, I might be persuaded to polish it up
and "release" it.

>appeared and one or two times this resulted in the loss of one file.
>

These are both read errors. $11 are unrecovered read errors, and $17 are recovered read data after retries. The AdSCSI manual says this about $11:
" The operation was terminated bith an unrecovered error condition probably caused by a flaw in the medium. This indicates that there is a problem, probably a bad sector. You should run a program such as Cleanup ST to check and map out bad sectors.

If this message appears while you are running Cleanup ST but no errors are reported in the program, then there are probably bad sectors that have already been mapped out. Similarly, any program that reads sectors without checking to see which are marked bad in the FAT may cause this message to appear, although there is no problem."

Could be bad news, specially with an imbedded SCSI drive.

CAD-3D

Computer Aided Design - Three Dimensional.

Basically, it's an 'art' package for designing real objects, in three dimensions. (art package is not a very good term).

If you have any use for this sort of thing. (Architecture is a major use of this sort of thing) - then it's probably one of the better packages around. It is commercial!

3389. What monitor to use with the Falcon

Newsgroup: comp.sys.atari.st
Date: 1993-02-26 04:49:44 UTC
From: tbrown@cis.ohio-state.edu
Message-ID: <1mk7h8INNar5@tortoise.cis.ohio-state.edu>
Source record: 209628

I'm contemplating the purchase of a Falcon, and was wonder which VGA monitor I should buy. I've head the interlace is too bad on the ST color monitor which is why I want a VGA. Also it could be used on another computer later.

Anyway, if I buy a *nice* SVA monitor will that reduce/enhance the screen flicker? Interlaced/non-interlaced? (And if it's interlaced at 1224x780 do I really care?) I would think a better monitor would help, but someone told me the exact opposite. So I'm doing the smart thing and punting the question.

I know *some* of you out there have falcons and have seen the screen. Its just that I *hate* screen flicker. So how bad is it really?

3391. Atari ST game for sale

Newsgroup: comp.sys.atari.st
Date: 1993-02-26 06:51:37 UTC
From: matthew@hitech.com.au
Message-ID: <730709491.9161@hitech.com.au>
Source record: 209630
Cross-posted to: comp.sys.atari.st,aus.forsale

Greetings,
I have for sale :

Original copy of NAVY SEALS. It's a good shoot-em-up game
very good graphics and medium level of difficulty. Original disk with
original documentation in original box. 6 months old.

Requires :
Joystick
Single-Sided disk drive
1/2 meg of memory
Runs in low resolution.
Atari ST :-)

Price : $30 I will pay postage.

Contact me if your intrested at matthew@hitech.com.au

ciao,
-matthew

3392. Wealth of Mods but what to play them

Newsgroup: comp.sys.atari.st
Date: 1993-02-26 08:32:02 UTC
From: jon_w@sn3008.oldham.gpsemi.com
Message-ID: <C31rpF.1LM@bailgate.gpsemi.com>
Source record: 209631

I have down loaded most of the Mod files from atari.archive.umich
.edu, I have manged to get them to play on my SPARC 10. But I
do not seem to be able to play them on my ATARI 520 STE (now 1 meg)

Is there a package that plays most of them, and also is it possible to
extract the samples and say, play them using a midi keyboard. I have
the TCB Tracker program (mph version from ST FORMAT) but it does not
recognise any of the files that I have taken home.

I have tried the 50play.prg but with little success.

Any Ideas ?

Jonathan

Ours is currently back at Atari due to a problem with the stereo
output.
It isn't playing the left stereo side, but is probably a hardware (ie.
connector socket) rather than a software/firmware error !

Damn! I hate it when that happens!

Because of direct DMA access and non-68030 code. Basically shit programming.

You might well ask why the PC version F1GP _DOES_ work on just about any PC with a {3|4}86{S|D}X and on hard disk. The Amiga version also works on hard disk. Dunno about A1200's though. Probably does.

Bottom line. Microprose stiffed ST users. They just don't care.

I really like to believe this. But this sounds worse than Origin's famous
"Strike Commander will be ready by christmas" line. No, don't get me wrong.
I'm not flaming you, I'm flaming the people who wrote the article. 64 bit
RISC based machine for less than 200, targeted at 90 bucks?!? Yeah right!
To match the processor, Atari must be able to include a robust sound and
graphics engine. Then they must include ample amounts of fast RAM for main
memory. To complete the machine, they must find a fast input device capable of
vast storage of information (face it. If you want killer graphics, awsome sound,
cartridges just won't do, as they are way too expensive), like a fast CD-ROM
drive that'll outperform the current crop of slow CD drives. These things are
not cheap! $99, a SNES maybe.

3DO, on the other hand, sounds much more realistic, coming in at $700-$800.
Form what I've heard, it is due out next half of this year (let's see
just how many times they'll postpone it's release..). Certainly one machine
to watch for. Boy, since Spectrum Holobyte is supporting it, I hope they port
Falcon 3.0 over for the 3DO.

64 bit custom RISC processor?!? Tell us more, give us some more specs on the
processor!

(Hey, I didn't say it's impossible, just improbable...)

> Setscreen(-1,screenpointer,-1);
> Vsync();
> }

On an ST yes but not always on a Falcon.
Say you draw a wee sprite image on the screen pointed to by screenpointer.
Then you call FlipToScreen. The sprite took such a short time to draw that the
Falcon has not started scanning the video RAM yet so it shows the new screen
immediately. The ST won't show the screen until the next VBL.
Perhaps in the next frame sprite has moved and now it's position means that it
might take a little longer to draw. This time both the ST and the Falcon
behave the similarly. Because of these differences though the sprite movement
on ST will look smooth but jerky on the Falcon. I confess it took me some time
to work this out.

>If so, then MANY programs should work. Those that use:
>
> FlipToScreen(char* screenpointer, int wait)
> {
> Setscreen(-1,screenpointer,-1);
> WaitUntilThisManyVBLsSinceLastCall(wait);
> }
>
>Should also work.

Again, possibly not. In fact as long as the screen flip position is constant
(ie. always before or always during the scan) then things look just fine.
The problems appear when it's not.
I have an example program I wrote that illustrates the problem on the Falcon
very well and demonstrates the fix.

>Anything else sounds like "hitting the hardware"... and such code deserves
>to die. I don't see think it is correct to say the Falcon's video chip

>has a "bug" just because it isn't exactly the same as old ST chips.

Actually, to be really honest, I think it's the ST that had the hardware bug
in the first place. This would explain the prescence on the system variable
screenptr @ $45E which is never written to, but is strangely read by, TOS.
Accessing hardware which Atari have documented in a documented way is OK.
Up to a point Atari recognise the need to bash the hardware and have designed
compatibility into all their machines. Until now.
It must be said however that programs will still work on the Falcon. They
just won't look so good.

>Dave Baggett or I wouldn't send our ST back for repair just because some
>program's "overscan" hack didn't work on our machines. (and probably
>has BUCKLEY'S on a Falcon).

Hardly the same thing. The ST was not _designed_ with the overscan hack in
mind. I wouldn't call screen flipping a hack.

What more can I say? Get access to a Falcon. See the phenomenon. Concur on
the solution.

OUTSIDE runs with MiNT 0.95 and the newer versions. In a few days there will
be a completely new version of OUTSIDE with lots of new features.
BTW, a very interesting combination is OUTSIDE together with Mag!X. Much
better and faster than MTOS.

|> ask ATARI first before saying 'seen on a Falcon here in Germany!'
Oh wow! Georg Acher and me developed this on my Falcon. We are NO REGISTERED
```

ATARI DEVELOPERS and as i've heard the registered developers did not get any information about the video-registers at all! So WE are the only ones (except from ATARI itself and some fellow freax) who know at least a bit of the meaning of the Falcons Videoregisters.

Fact is: The Videohardware of the Falcon is FREELY PROGRAMMABLE. So you can switch to a resolution of 4000x2000 if your monitor would be capable of a 10Hz framerate. The more pixels you see the slower the screen refresh will be. Sounds logical, doesn't it? So at standard the Falcon runs at 25MHz Pixeltakt which is the basis of all calculations. This results in the standard VGA-resolution 640x480 at 31,xx kHz hor. and 60 Hz ver. frequency. So far the standards.

Now there is a way to switch the internal pixelclock from 25MHz to approx. 32MHz. This results in higher frequencies if you don't change the resolution. This is exactly what Super78 does. If you don't want to have higher frequencies you can increase the screen resolution. For example 800x600 without external hardware. We have not done that with 256colors yet, but this should be possible too. The cause for this is that we concentrated on the 16color mode. Well we had to start SOMEWHERE!

With external hardware we have done 1024x768 at 83Hz
interlaced (also 16 colors). Interlaced does not flicker at this screen rate, you can believe that. And you can even increase that if you feel good with 50Hz interlaced (some people may ...).

So stay calm, trust in God or whom ever you want to trust in,

Michael Eberl, eberl@informatik.tu-muenchen.de

It depends on the time of the month you look, from experience I have found
that the Amiga mags can sell out quite quickly whilst the PC ones stay on
the shelf for some reason.

>- Leo

From memory I can name the following Amiga mags available in the UK.

Amiga World
Amiga Shopper
Amiga Format - The biggest selling computer mag in the UK for ANY machine type.
Amiga Power
Amiga User International
Amiga Computing
CU Amiga
Amiga Action
Amiga Mart

I know there are others but can't remember the names, feel free to add
them.

3405. ICD scsi commands group 1-7?

Newsgroup: comp.sys.atari.st
Date: 1993-02-26 11:23:12 UTC
From: dick@ahwau.ahold.nl
Message-ID: <C31zMq.Fxq@ahwau.ahold.nl>
Source record: 209645

I have a question, about the ICD hostadaptor for SCSI devices.
Is it possible to send SCSI group 1-7 commands to scsi devices
connected via the hostadaptor.

Some explanation :

Normally the commands are build into an ACSI command block, the first
byte contains the target number (3 bits) and the command in the lower 5 bits.
The host adaptor splits this byte into 2 bytes if the device is scsi, to
build a "normal" scsi command block.
This scheme cannot be used with group 1-7 commands. The command number is
bigger than 5 bytes. And there are some usefull commands in group 1-7!

So the question arises if there is some escape build in, in the host adaptor,
to put the "real" scsi command number somewhere else (in a next byte?).

Anybody some answers, some ideas?

I think this thread was about *MUSIC* magazines... I think he means that all
MUSIC magazines in Europe focus on Atari and in NA on Mac/PC

3407. ST games on a TT

Newsgroup: comp.sys.atari.st
Date: 1993-02-26 11:38:10 UTC
From: jdmt@dcs.ed.ac.uk
Message-ID: <C320Bn.Mzp@dcs.ed.ac.uk>
Source record: 209647

A lot of people seem to be under the impression that TT's won't run
ANY ST games.As a TT owner,I can say that this is just NOT true!A lot of
ST games _don't_ work on a TT,but there are often simple reasons for this.

For a start,68030's are so much faster than 68000's that a lot of
the disk protection routines fall over because they time-out before the
floppy has had time to access the correct sectors!Also the '030's instruction
cache causes all sorts of problems with self-modifying code that doesn't know
about caches.Therefore the trick is to turn OFF the '030's instruction cache
before booting your game.This however is not easy with auto-booting games,but
I have some code which will run _most_ bootsectors from the desktop.
Another big problem with ST games on TT's is that they destroy the '030
MMU's memory translation tables causing the machine to hang.The cure to this is
to whisk the translation tables out of harm's way by moving them to TT-RAM and
then pointing the SRP to them.Once you have done all this,your chances of running
ST games are much improved.There are still some TT-hardware problems - TT's only
seem to want to run at 60Hz/70Hz and if you try to stick them into 50Hz,you can
quite easily turn off all the syncs - leaving you with no display and worse still
no VBLs or HBLs!

Anyway,I suppose I should end this posting with a list of ST games that I
have managed to run - this is _not_ a complete list of all TT-compatible games,but
it is at least a start!

F16 by Digital Integration
Robocop 3 Ocean - really,really cool on a TT!
Microprose Grand Prix - also good at 32MHz!
Starglider
Drive Harder Domark - faster than the arcade!
Falcon Mission Disk 2 (STE version)
Interphase

These are all that I can remember right now,but there are probably more.

I anyone is interested in the sources for running bootsectors from the
desktop and for moving the MMU tables,just mail me.If enough people hassle me I
might just post them.

Anyway,bye for now,
Cheers,Joe.

I think the original poster was talking about the content of MUSIC magazines-
they are mainly Atari, not the number of Atari magazines.
Anyway, there are at least 4 ST magazines in the UK.

Yup, that`s true. Turbo C is now called Pure C and is distributed by
Applications Systems Heidelberg (Germany) as far as I know. As far as
I recall from a friend, update is possible, but I am not certain, because
I don`t program in C.

Hope that helps,

Sounds to me that there is an error in your assign.sys file. It is looking
for a GEM.SYS file when it should be looking for META.SYS. Load the assign.sys
into an editor and change any occurence of gem.sys with meta.sys. Also, make
sure that your GDOS disk _has_ all the meta files, also.

I don't remember which version I got recently, but it seemed to un-lzh (or whatever it was compressed with) just fine. Try to get the HSC again. It is a good compiler and the GEMFast libraries are great, especially for a beginning GEM programmer like myself.

3415. Re: What res is VGA?

Newsgroup: comp.sys.atari.st
Date: 1993-02-26 14:04:33 UTC
From: wbdst+@pitt.edu
Message-ID: <4788@blue.cis.pitt.edu>
Source record: 209454

This question of VGA modes recently came up on the FidoNet graphics echo... VGA is "Video Graphics Array", which was invented by IBM. The VGA spec does NOT include any higher rez than 320x200 for 256 colors (excetxxx except some "weird" modes, which I believe are not officially supported, like 320x44xxx 320x400, which I mentioned). The VGA spec's highest rez is 640x480, which allows 16 colors. Anything higher than VGA is super VGA (although not all SVGAs are created equal). Thus, 640x480x256 is SVGA.

It is true that Falcons are going to music distributers now and 'games' distributers at the end of March. Perhaps Atari think users like us already have STs and will buy Falcons when we can whereas musicians might decide to go to another platform?

The first sentence was what the Atari bloke said, anyway...

>
> And also if anyone knows of any cheap DIY yupgrades for more ST Ram.

Don't buy ST RAM - it is really very,very slow!ST RAM on a TT
is 64 bits wide to the video-chip and 32 bit wide to the 030,but the
memory timing is based on alternate 250ns time slices i.e. the video
gets 1 read every 500ns and the 030 gets 1 read every 500ns.This means that the
030 can _only_ read/write upto 8Mb/s from ST RAM.TT RAM on the other hand is
32 bits wide,and clocked at 16MHz.Therefore in burst mode,you should be able to
read 4 longwords in 1*180ns+3*60ns=360ns (assuming one normal RAS/CAS and 3 page
mode reads) which works out as about 42Mb/s which is much better.

Both ST RAM and TT RAM cards contain DRAM controllers in addition to
the memory as the TT's ram connectors are just slightly modified processor
busses.Official TT and ST ram boards have an Atari custom chip as a DRAM
controller,but TT RAM boards like the GE-Soft one I own usually have loads of
GALs to do the memory timing/refresh etc.

I cant see any reason why it would be all that difficult to make a TT or
ST ram board yourself,provided you have access to a GAL programmer and a copy of
the TT's schematics,and ofcourse,you know a lot about DRAM/68030's.I would really
like to see someone produce TT and ST ram boards cheaply as the current U.K. price
of about 250 pounds for an UNPOPULATED TT ram board seems excessive.I would
especially like to see someone produced a TT ram board with a large (=>256k) SRAM
cache as DRAM performance isn't all that good compared to a 32MHz 68030.

I hope I have been of help,

Cheers,Joe.

>probably talking about part of the eye we don't use for looking at colours.
>More fool me for the extrapolating this behaviour (without even thinking of
>checking my workstation next to me :-|) to colour receptors.

There are two kinds of photoreceptor cells in the eye. Cones, which detect
colour but are not terribly sensitive, and rods, which are black-and-white
only but are very sensitive. Both work just as well at night as during the
day, but the cones don't work well under poor light. In a dark room,
even the most colourful of objects will appear as grayscale to the human eye.
Time of day has nothing to do with colour perception.

One thing to take note of: colour theory states that there are three apects
to colour: hue, intensity, and value (okay, sue me if I got the words wrong.
I have the concepts straight in my mind but have difficulty relating
right-brain abstract colour concepts with left-brain verbal reasoning).
Colour theory was based on pigments. Video displays work on a different
basis: they have three colours (red, green, and blue) that can be added in
varying amounts to simulate colours of different hue, intensity, and value.
Video uses additive colour, pigments (and "true" colour objects) use
subtractive colour. That means you can come close to emulating "true colour"
(by which I mean things look on the screen just like they do in real life)
in video, but you can never get it exact.

>Note 50 shades of grey on a monitor is not a test of your B/W receptors in your
>eyes, it's a test of the colour receptors in your eyes.

I would beg to differ. Video monitors generate enough luminance that both
types of photoreceptors are stimulated. Note that your rod cells are most
sensitive in the yellow band of the visual spectrum, while cone cells tend

to be either blue-violet sensitive or red-green sensitive (which explains
red-gren colour blindness).

Certainly!

Never heard about such a bug, and there probably is no such bug, because
quite a few people have done what you intend to do. You will special
disk driver software, though, that supports the second drive. AHDI
won't do that.

Gribnif (makers of Neodesk) now handle Pure C, as well as STalker/STeno,
XBoot, Cardfile, and other programs. I just got a newsletter from them
yesterday (coincidence?). I will post an address so you can get a copy as
well. There was a specific section on upgrades, but I cannot remember the
specifics for Pure C.

I'll trade you. You can play most MOD files with NoisetrackerST. It is
now called something else (Digital something?), but it is free and should
be on atari.archive. It sounds very good compared to previous versions of
Noisetracker. If you cannot find it, let me know and I will put it there.

Also, there is a conversion program for the Soundtracker that converts many
MOD files to the soundtracker format.

Now, could you email me some help in getting the Sun modfile player? It
would be nice to play some mod files at work!

3430. 5.25" 360K floppy drive for sale

Newsgroup: comp.sys.atari.st
Date: 1993-02-26 19:08:50 UTC
From: braner@trantor.emba.uvm.edu
Message-ID: <1993Feb26.190850.18742@uvm.edu>
Source record: 209470

"Microbyte" by Paradox. External DS/DD floppy drive for ST. Reads
and writes MS-DOS-compatible 5.25" 360K diskettes. I have a program
that lets the ST format such diskettes too. It has seen little use,
and is in great condition. Original cost $200. I no longer use this
thing, so make an offer.

|> Fred Heitkamp, ** Not an organization. My opinions only **
|>

I can't agree with this assertion, mainly due to the fact that the phosphor's response is proportional to the excitation response or in other words its response is continuous not discrete. In other words the phosphors are capable of an infinite number of brightness levels. Perhaps what is being alluded to here is the dynamic range of the phosphor response.
If this is the case, then I basically agree, but then once again the limitation is in the viewer's physiology, since the phosphor's are capable of many more shades, we just can't discern between them with our eyes. However the eye has some interesting capabilities, which are often neglected when this whole topic is discussed. As I indicated in my earlier post, the eyes response peaks in the green part of the spectrum, and is best at picking up artifacts here. Also there is something called the Mach effect (I'm not sure of the

spelling), which basically states that the eye is oversensitive to differences in luminance levels when adjacent (basically the eye takes the first derivative), causing bands to appear at their juncture. This is why I mentioned bandwidth, low monitors will smooth the transition between shades, moderating this effect. Sorry about the brevity of my last posting, I was sorta rushed that day. Hope this sheds some light.

>I'm not flaming you, I'm flaming the people who wrote the article. 64 bit
>RISC based machine for less than 200, targeted at 90 bucks?!? Yeah right!

This is easily achievable. A RISC processor can be a relatively simple
item, especially if you're not too concerned with running it at a very high
clock speed. Produce in quantity they need not cost much at all.

>To match the processor, Atari must be able to include a robust sound and
>graphics engine.

The Sega Genesis and SNES both have "robust sound and graphics" for under $100.

>Then they must include ample amounts of fast RAM for main
>memory.

RAM is now going for about $40 for 1M (that's 8megabits) retail.
The Genesis and SNES both have less than 0.2M.

>To complete the machine, they must find a fast input device capable of
>vast storage of information (face it. If you want killer graphics, awsome sound,
>cartridges just won't do, as they are way too expensive), like a fast CD-ROM
>drive that'll outperform the current crop of slow CD drives. These things are
>not cheap! $99, a SNES maybe.

Very true. I haven't heard much about the Jaguar, but if it doesn't have a
CD-ROM it's just a waste of time.

>3DO, on the other hand, sounds much more realistic, coming in at $700-$800.

$700 is the release price, for the "I gotta have it now" types. It is supposed
to retail for $500 after that. If it takes off the price will go down a lot
further (IMHO).

3438. Super fast GIF viewer on atari.archive!!

Newsgroup: comp.sys.atari.st
Date: 1993-02-26 22:05:20 UTC
From: stusoft@hardy.u.washington.edu
Message-ID: <1mm470INNpko@shelley.u.washington.edu>
Source record: 209478

I've posted this note to announce that atari.archive.umich.edu has posted my GIF viewer called Speed of Light (spoflite.lzh) in the Graphics folder. It works on any ST/STE/TT in 16 and 256 color graphics modes. Its speed is due to Assembly Language routines. It has one of the best color reduction algorithms I've seen (invented by me), so 256 color GIFs look better in TT Medium (16 colors) than in TT Low (256 color). It uses a flickering method (that is hardly noticable) to increase the number of colors to 32000+ on an STE. With regular STs, you get the palette of an STE and more. It also displays in greyscale, so your GIFs will look like a photograph in 32 grey shades!! You can also do pixel averaging that smoothes out the jagged lines normally found when you reduce a picture.

This program is SHAREWARE, so your support is appreciated. More info with the program.
Registering will get you a key code for the next version which will support more picture formats, the ability to save the pictures in a different format, and dithering that will NOT be any slower than the program is now. To use these features, however, you must have a key code. It will also work on the Falcon030 in 256 color 640x480, increasing the palette to 16 million! Until then...

This is a follow up to my post about Speed of Light...
There seems to be a problem with the program running on regular STs or Mega STs. 2 bombs appear when it is first run. I'm not sure if this is due to these machines, or if its tos versions <1.4. Anyway, I will be releasing version 2.1 within a week. This version will fix this as well as work on the Falcon030. As it is now, the program runs on the Falcon, but the color palette is screwed up...this is fixed now.

Please DO NOT send me Email about any of the above problems!!!

Thanks for you patience...

Nope. Half the time the Subject: field is bogus, or marginally relevant to the message contents. I agree with the comment that there's too much uninformed vendor bashing, and far too much discussion of true color (or colour) in this newsgroup. I've been using the "catch up" feature a lot lately because of this. The advocacy group can't come any too soon for me, and I hope a Falcon group will be the next addition to the comp.sys.atari hierarchy. I started reading this group for ST info, and there hasn't been a lot of gold amidst the crap lately.

Atari bought the machine (Lynx) from EPYX. When they got the machine, they
decided that they wouldn't gain anything in converting the developers kit
from the Amiga to the Atari. It would actually be a big waste of money,
something that Atari could ill afford to spend.

The posting was a little unclear (I should of included the previous letter)
in that it refered to MIDI stuff only, not general computing.

3450. NEODESK v3.03A now available at the archives

Newsgroup: comp.sys.atari.st
Date: 1993-02-27 03:57:31 UTC
From: rmsara@ecst.csuchico.edu
Message-ID: <1mmorbINNcqm@charnel.ecst.csuchico.edu>
Source record: 209490

The patch to convert Neodesk v3.02 to Neodesk v3.03A is now available in the atari archives at UMICH. It's filed under Utilities. This is the U.S.A. version only. The listed name is NEOP302A.ZOO. Remember, you must first have converted to v3.02 before you can use this patch. If I remember rightly the patch from 3.01 to 3.02 is also at the archives.

3451. HP-Laserjet GDOS Fonts

Hello Everybody!

I need some help.

Can anybody tell me where I can find GDOS-Fonts for
my HP-Laserjet II compatible Printer?

I was not able to discover any in the ftp-sites I
checked so far and I really need to print out some
stuff. So, I would really appreciate some help.

Thanks!.....Rob

Playing MOD's.

If you have an STE, virtually any MOD player will work. (Paula, Jukebox,
Protracker, Noisetracker, AG-Tracker, M-Player, Digital Composer,
Sync/Audio Sculpture)
If you have an STFM, all of the above, except Paula and Jukebox
will work! (Without modification that is).

50play.prg is STE only!

So, since you have an STE, 50play should work fine!

TCB-Tracker uses it's own format for
MOD files, which is a bit odd. But, if you can FTP the program
'Digicomp.???' then that will play virtually anything.
or, 'paula20c.???' (I think).

Well I THINK GIFSHOW1.2 is available on the ataris.archive, it works in
all three resolutions, but I think it's shareware, and it's not especially
speedy at all. It'll show most colours, ie: 256:101, <-- 256 colours orginally
and it'll be showing 102 on screen.

The Atari computers, even the old STfm's, are better overall in performance
(ie OS in ROM's, BUILT IN GUI:GEM) than a 386 PC.
A 30 MB hard drive on an ST will last a hell of a lot longer on an ST than
any PC (talking in terms of free space)
. And what else can you compare to a 68030, DMA, DSP equiped ATARI; a
386??? :)

Actually, I'm having trouble ftping photochrome from atari.archive.umich.edu
, when I d/l it from my account that I ftp'd it to, it un-lzhs to garbage, I've
tried 2 different UNlzhers, one says everything is fine the other says that the
lzh'd file has a bad header!!

Could some point me to a working copy? Or possibly mail me one?

P.S.: It was called pchrome3.lzh...

s>the original drive. Now the question, I have a spare Seagate 225 MFM drive
s>sitting on my kithen table, what would be needed (and what do I have to do)
s>to add this drive to my system? Can the Adaptec card handle 2 MFM drives?
s>I heard from ICD that the Tandon drives in the SH204's had a hardware bug
s>that caused them to respond on all luns when queried? would this complicate
s>the issue severly? Sorry if this is simple but I do not really no much
s>about MFM technology.

I have an Adaptec 4000 board here running two Seagates, the original 225 an a
251. The host adaptor ACSI->SCSI is the one with the bug, I replaced it with an
ICD Advantage. Works fine, the ICD software recognizes both drives and an
additional SCSI drive.

All you have to buy is

- an ICD SCSI adaptor with software (as AHDI doesn't support two drive MFM
setup)
- cables: the wider one has to be replaced with one that has two drive
connectors, and a second narrow one.
- a new case with powerful power supply (nice sentence :-( )

Plug all the stuff together, and it will work.

(Besides, MFM drives cannot have firmware bugs because they have no firmware.)

- Peter -

3463. Re: How Many Colours is true ColoUr?

Newsgroup: comp.sys.atari.st
Date: 1993-02-27 16:27:22 UTC
From: brianm@sco.com
Message-ID: <1993Feb27.162722.16654@sco.com>
Source record: 209203
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.hardware,comp.sys.amiga.advocacy

First, a definition of "true-color". True-color is when the value
you put on the screen is not passed through a pallete to produce a color.

These are most likely 24 bit systems, of 8 bits red, green, and blue,
however they can also be 4 bits each of read, green blue. The key is a
lcak of a palette which changes the color.

hello@bnr.ca (Ken Orford) writes:
>snail@lsl.co.uk wrote:

>: > snail@lsl.co.uk writes:
>: >
>: >>24 bit = 16 million colours. Your eye cannot see that many colours.
>: >> 256,000 colours. Your eye cannot see that many colours.
>:
>My wife is taking a medical imaging course and her reading materials
>say that the number of grey levels a human eye can discern is between
>16 and 32, but never more, so I'd be very surprised at 256 color levels.

The key is discern? I a, more than able to discern 64 shades of grey
under the right circumstances. 256 shades of grey I have problems with
unless the conditions are really good.

Now comes the issue of color. There are seperate receptors in the eye
for color and black and white. Your wife should learn this. I have
no idea how the receptors work in regrads to figuring out colors.

Most times 24 bit color is more than enough, and even 16 bit color
(5 red 6 green 5 blue) is more than enough. There comes a problem
when the computer tries to actually emulate real life, with the varied
intensity levels of light.

With a large enough screen, if you tryed to get a bright green,
which would be the bright daylight scene, and then reproduce the
number of levels available in the shadow, you would fail.
Because the eye can change the amount of light coming in via the iris,
you need to be able to either track this change by brightening all the
colors at once or by having more colors available. The first
method isn't "true-color".

An answer for those who say that the eye can't see more than
X number of colors? This is probably true under a constant light
intensity, but not across all light sources, especially when
one scene has many light levels and requires great detail.

It's interesting that your wife was told this, and some other medical imaging specialists are crying for 16 bits RGB, so they can get the detail they need.

Talking about character classes, is anybody else experiencing the same
problem as I, that is, whenever I try to choose samurai as my
character class, the game will exit to desktop along with 2 bombs.
This happens when I press space after the initial texts telling "Go
bravely with Amaterasu Omikami".

BTW, any news on when the next patchlevel is going to be ready?

Hi.

It mentions in the Falcon user manual that a program called SHIP.PRG
should be used to park the hard drive when transporting the Falcon.

I've looked everywhere but couldn't find it.

Any of the other falcon heads know know about this program?

On the other hand, when flying into the Frankfurt airport, there is a large building With "Atari" painted on the roof that is visible as you make yoor final approach. I assumed this was Atari's international headquarters <g>.

Commodore has ads inside the airport, but they didn't go to the trouble of painting roofs.

I got it from a.a. today and it worked fine on my MSTE (TOS 2.05). I ran
it on the master disk I had patched from 3.01 to 3.02.

While I'm posting, has anyone else noticed a conflict between NeoDesk 3.x
and MultiDesk Deluxe?; at least on a Mega (Tos 1.02) I get many bombs
whenever I try to use desktop icons (on the NeoDesk desktop) or access an
accessory, when MultiDesk Deluxe is loaded. Of course, I realize there
could be some other unfortunate interaction going on between various Auto
folder progs, and accessories.

John

>won't do that.

"I never heard of it so it can't be so." What an enlightened attitude.

In fact there is such a bug in some early SH204 units. I have one. As
far as I've heard, it only affects SH204s which have a Tandon mechanism
inside, but it could affect others, I'm not sure. My original SH204 would
respond to any LUN number (0 - 7) on its controller, and that prevented
ever adding a second mechanism, even though the Adaptec 4000 can handle
two. I eventually just punted the Adaptec and the Tandon, and added an
ST1096 SCSI drive in their place.

>
> Yep - same for me. I was on the mailing list, but that seems to
> have stopped for some reason. Can anyone tell me why ? Atari.archive doesn't
> even seem to have the most recent version either.

Each issue of Z*NET Atari International is posted to the NET on Monday
morning USA time (or Tuesday for us in the southern parts of this place
we call Terra) in the news group "alt.ZNET.PC" .

We do NOT offer a mailing list as here in NZ we hace to pay for all
email and after a three month bill of over $2200 for the mail server
here we removed it.

WHY? well as you all know Z*NET is a labour of love and I personally
have to pay all the bills. As I am a general site in the NZ domain
(non-commercial site) and have no sponcership for the mail we created
the alt.znet newsgroups.

This was after a RFD to create comp.sys.atari.znet where YOU chaps
(not all of you but a vocal few) decided this was not a good idea.
So we went to the alt groups instead.

The alt.znet groups are in global distrubution. Some sites do not
carry the alt.groups and this is a problem for a few of you, I am
sorry there is nothing I can do about this bar.....

Allan here at dogbowl.acme.gen.nz has asked about a CFD for
comp.sys.atari.znet again to allow ALL sites to receive the weekly
postings.

If Alan wants to go ahead and re-kindle the CFD I am happy to place
all the magazines in here for the world.

However you will have to support the CFD and get the "100" votes etc.

But until this happens please feel free to read alt.znet.pc each week
until they arrive in the comp.groups.

Kind regards

Jon Clarke

>Isn't it powered by the motorola 88k? I think I heard this 18 months ago!

The Jaguar have a custom designed 64 bit CPU frome what I can read out of all
the information I've heard from several sources. This chip is designed by
Atari in cooperation with Motorola who probably are going to produce it.
One of the chips in the Falcon was also a Atari/Moto design (think it was
the dma 8 channel sound chip).

My guess is that some of the kernel of this new CPU is taken partly from
88K development and partly from the DSP96000 development. If this is true
we may be looking at a VR cabable game-console for < 200$ (though it probably
will need som kind of upgrade-kit to REALY handle VR, like CD-rom, special
gamecontrol devices and 3D displays).......

And NO, I'm NOT going to buy it!!! Then I suerly would becom a gamaholic!!!

Disclaimer: I realy do not have any REAL inside information on this subject,
I only make assumption on what the most reliable sources have
come up with, and i feel no responsibility, wether what I have
written here is correct or not:-)

3477. *** TADS 2 for Atari ST/TT/Falcon now available ***

Newsgroup: comp.sys.atari.st
Date: 1993-02-28 18:43:13 UTC
From: dmb@case.ai.mit.edu
Message-ID: <1mr141INNrti@life.ai.mit.edu>
Source record: 209223
Cross-posted to: rec.games.int-fiction,rec.arts.int-fiction,comp.sys.atari.st

I've posted a preliminary beta release of TADS 2 for Atari computers on ftp.gmd.de in if-archive/programming/tads under atari.tads2exe.arc. For those who don't know, TADS is an object-oriented programming language designed just for writing Infocom-style text adventures.

Please note that this is NOT an official High Energy release. While it is based on the latest (2.0.13) released TADS sources, it still has some bugs introduced by the porting. Since I'm doing this entirely for free, I would appreciate help from those who are interested in playing or writing TADS games on their Ataris: please download it and let me know of any bugs you find. The more help I get, the faster this will be made into an official High Energy product.

Please DON'T bug High Energy about problems specific to the Atari version. The only person who's going to fix anything in the Atari version (for the near term, at least) is me. So bug me. :)

Exciting features new to this port:

- TADS 2 features! Virtual memory, C-like syntax, 100% binary portable .GAM files, and more!

- All new screen handling code. Now uses VT52, so it's much faster and responds properly to screen accelerators like Warp 9. Should me more friendly in multitasking environments like MiNT (though I have not tested it under MiNT and would like to hear if it works). Should work with all versions of TOS and all CPU types. (Falcon owners, please give it a whirl and let me know how fast it is!)

- Compiled with GCC 2.3.1, so it's probably faster in some places than the previous port (which was built with Mark Williams C).

Finally, I have made portable versions of the Unnkulian Unventures that you can try out with your new TADS! FTP to ftp.gmd.de and look in if-archive/games/adventions/others. You will need to uncompress and untar the files on a Unix box if you don't have the GNU versions of those programs running on your Atari. (The Index in that directory tells you how to do this if you don't know.)

Happy adventuring!

Dave Baggett

It's pretty rare to find a 520 these days, Atari are only releasing the
1040 models, as 1/2meg is almost obsolete with SS drives!

> Just hit cancel and it will continue like normal. Don't worry about it.

Thanks, that fixed it (actually, I hit "skip", but I presume that is what you meant). I am using 3.03 right now, and it is nice. Warp 9 does speed things up (I have Neodesk in VDI mode). You also mentioned some problems with autobooting. I have had none, but I am not using a ram disk either. Also, I have Fatspeed running before the cookie jar program (jar10). Could this cause me a problem in the future?

BTW, I cleverly managed to forget that each resolution has its own icons, so I ended up losing the ones I made up for medium and low res (not very many, fortunately). Don't do the same!

I downloaded it from a.a last nite with no problems whatsoever. It came in two parts. BTW, I've played with it just a bit and so far so good! I am interested in a/b'ing it to the output derived by using gif2raw to convert the files to .raw format, then viewing in Photochrome. I've converted most of my gifs this way so far, because I've found the resulting pictures to be superior to just about anything I've seen thus far.

Anyhoo... try it again under Graphics/spoflite.lzh and you should be able to receive it. Good luck!

3482. Problem installing Neodesk 3.03 patch

Newsgroup: comp.sys.atari.st
Date: 1993-02-28 22:57:23 UTC
From: bhawker@oneb.almanac.bc.ca
Message-ID: <cyePZB2w164w@oneb.almanac.bc.ca>
Source record: 209217

I have downloaded neop302.zoo from a.a last night. It came in parts aa to ah. After uudecoding it and unzooing it, I am left with the following files:

mac_conv.prg
patch_cn.prg
read_me.txt
patch_cn.dat
mac_conv.rsc
patch303.prg
secret.txt

When trying to perform the patch on my original neodesk3.02 disks, I just get a dialog box stating "can't open data!". The read me file mentions something about "copy the eight 'data' files to the same directory" as the patch303.prg. Obviously I'm missing some data files here. Either I didn't receive all the parts from a.a., or something else is amiss. What did you others who have successfully used the patch have for files and for uudecoded parts sent from a.a?

Thanks for your help...

I was wondering if anyone knows of a store where I could purchase a modem for an atari st, for pretty cheap? Preferably in the San Francisco/Monterey bay area.
Or does anyone have one they want to sell? Or does anyone have a phone number for a good mail order service that sells modems?

Thanks, all replys to
schlepp@am.ucsc.edu

3484. Selling it all!

Newsgroup: comp.sys.atari.st
Date: 1993-03-01 01:24:52 UTC
From: Brian.Lane@f1632.n203.z1.fidonet.org
Message-ID: <731072696.AA01019@royaljok.fidonet.org>
Source record: 209218

I am selling my system. No fooling this time! I have to come up with some
money, so it has to go.

90 megabyte harddrive, ICD AdSCSI Plus adapter(with clock), case and
powersupply - Includes lots of software and my BBS on it $350.
Also includes Calamus 1.09N and a whole schmere of fonts and
clipart. Also has DT Paint, an excellent monochrome touchup/drawing
program.

Atari 520STe 1meg computer with TOS 2.05 installed - only a year old.
Only $300. Includes Sound off! sound digitizer cartridge.

Atari 1040 ST with a custom extended keyboard and 2 megs of RAM, has a
ASTRA 4 meg ram board, just needs 2 more megs of chips $200

Atari SM 124 monochrome monitor - $75
Atari SC1224 Color monitor works great - JVC version $250
Atari SC1224 Color monitor - no RED - $50
I have a bunch of misc. software that comes as a PACKAGE, $200 for all
GFA-Draft plus 2 Cyber Paint
CAD 3d, related programs(cyber studio) Bards Tale
Barbarian(excellent game!) Middle Earth
Elite Jet
Thunder(spell checker) EZ-Calc
Mark Williams C v3.0.6 with c source debugger
Brataccas Phantasie II Advsys from Antic
Tempus Sundog DB Master one,
Gunship ///Turbo board Lattice C v3.03.01
MT-C shell
Micro C tools Dollars and $ense ST-Talk
Connect v1.0 Flash v1.6 Word Up v1.3

I also have some hardware - a dead 520ST w/1meg,
parts of SS/DS floppys, an extra mouse. Abacus ref. books.
an extra ICD SCSI interface card. All included with the software.

If you want it all, give me a call and we'll see what we can work out.
There is also the possibility of personal delivery - depending on where you
live. Otherwise you pay shipping charges.

I ftp'd the patch, so didn't have to deal with a uuencoded file. The neop302a.zoo archive should contain a bunch (perhaps 6 or 8, I don't recall exactly) of files called data1, data2, ... Obviously these were somehow missing from your archive. Perhaps you should try getting it again?

First in a long line of machines? Sheesh, they can't even get this one
out in a timely manner. And they're already about three years behind
the "cutting-edge" of technology.

> I got the impression from talking to various people that the Falcon040 would
> be 'announced' before August this year, possibly at Cebit.

That would be incredible; I'll believe it when I see it though. Maybe
there's hope of getting a decently fast computer out of Atari in less
than two years.

Not a good thing. The computer was crippled in the name of STe
compatibility; if that compatibility isn't there, it will suffer for no
reason.

3489. Lump-packet v2.01

Newsgroup: comp.sys.atari.st
Date: 1993-03-01 03:00:44 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1mru8sINNb7@golem.wcc.govt.nz>
Source record: 209225

Does anyone know how the Lump-packer works. I have the depack
routine, and have set it all up, except it says, change the size
to that of the file. Which file!? I've tried changing the numbers
but I either get 'data too large' or 'garbage characters'.

The code looks like this:/ (68000 assembler)

```
> TEXT
> Begin
> BRA L0004
> L0000 DC.B 'lumpfile.lmp',0,0,0,0,0,0,0
> L0001 DS.W 1
> L0002 DC.B 'filename.prg',0
> L0003 DC.B $1B,$45,$1B,$66,$1B,$77
> DC.B 'Enter welcome',13,10
> DC.B 'message',13,10
> DC.B 0
> EVEN
```

That is just the first routine. I would presume I change something
in there. The doc file says:/

```
> When using Chunk/Lump source, you will
> need to change a few bits.
>
> First change the lump name (if you are
> using one).
>
> Then change the program name which you
> want to load.
>
> Then change space reserve size to chunk
> size.
```

the last one is what I have problems with. This sounds like quite a
useful little program, as it means I can put all of my hundreds-of-files
programs, into a single file, which should work quicker!
(Due to not needing to access the floppy).

The file in question, is described as 28A66 bytes long. (166502 bytes)

Thanks in advance....

I have been looking for a Data Base for quite some time now with no luck. What i am looking for is one where you create the fields and they will be listed in a form like:

```
Name------- Age DogsName--- Job------- Height- Weight- 50mDashTime---
Jo Baba 23 Rufus Hogbloger 5'2" 123lbs :30
Kim Mitch 97 Guit Bum 6'5" 347lbs 1:04
Cal Run 21 Bill Lawyer 3'2" 39lbs :09
Min Bo 29 Kat TV Dinner 0'1.5" 1.5lbs 1:20:3
```

Everything I have every found produces nice little cards that are of no use to me. I need a list like the above for it to be useful. *None of the databases on a.a have anything CLOSE to what i'm looking for*

Can anyone help me? PD/Shareware prefered but if i have to pay for it i certainly will

Keith

3492. Re: ST games on a TT

Newsgroup: comp.sys.atari.st
Date: 1993-03-01 06:47:02 UTC
From: pelletier@Nyongwa.CAM.ORG
Message-ID: <C376uG.A0z@Nyongwa.CAM.ORG>
Source record: 209370

Because TOS 3.06 boots the TT directly in TT-medium rez, there are problems with games like Dungeon Master (which of course run in ST-low). I have to do it in two steps: (okay, three steps!)

1. Get the machine to boot from floppy; (necessitates perfect timing with that "Alt" key!) Two smaller copies of the FTL logo will appear at the top of the screen.

2. then, do a Ctrl-Alt-Del (if the TT booted from the floppy once, my experience is that it will warm boot from the floppy again 90% of the time).

3. then, (with perfect timing!) hit "Alt 1" just after the Atari logo pops up. This will switch you to ST low rez. The FTL logo should now appear, in beautiful ST low rez; you are set to play.

I never had to do this much grovelling under TOS 3.05; all I had to do then was to stick the DM disk in drive A and reboot.

I there something like DC Bootit! that would work under TOS 3.06?

Source record: 209232

Well, I just got hold of Cubase this weekend, been spending a little bit of time with it. It seemed to run just fine on 640x480x16 color mode, tho all it does is use the black and white colors. Haven't done any really intense work with it yet (there's a huge amount of manual to read there, y'know!) Btw, this was on TOS 4.01 in ROM. I haven't tried the RAM-loaded 4.02 yet.

>
> "I never heard of it so it can't be so." What an enlightened attitude.

Ian, please read more carefully. I wrote that there probably is no such bug because I know that there are people who use two MFM drives inside a SH204, not because I never heard about any problems (though this alone would also be quite a good indicator, since I can count on the accumulated feedback from more than 10000 readers of my book).

> In fact there is such a bug in some early SH204 units.

There is a bug in the SH204 host adapter PAL, that's right. Its effect is that the controller never seems to report an error to anything you send to it, i.e. the status byte will always be zero. (Actually, the controller does send all the correct status byte, but they are lost on the way.) If you try to detect the presence of a second drive just from evaluating the status byte response to a read command, you're out of luck, and that's probably why ICD says it can't be done. If you have additional error checks in your driver, everything will work fine.

> My original SH204 would
> respond to any LUN number (0 - 7) on its controller, and that prevented
> ever adding a second mechanism, even though the Adaptec 4000 can handle
> two.

This sounds exactly like the problem described above, and it can be solved by additional checks in the driver software.

This must be absolutely incredibly fabulous on a TT! I've played it on a
friend's ST and it was the most realistic driving simulation I have seen
anywhere, but it was just too slow, so I didn't buy it.
Has anybody got this game working on a Falcon (I heard it was incompatable,
but then I heard it was incompatable with the TT too)?

> Drive Harder Domark - faster than the arcade!

Ditto, but not quite as much.

>interlaced (some people may ...).

Mega, mega, mega, mega, wow, mega, wow, mega!!!!!!!!
(Sorry, it must be the snow that has got me all excited).

My ONLY complaint against the Falcon was the lack of some bigger screen modes,
and now it seems we can have as big screen modes, limited only by the speed of
the pixel clock.
If 800x600x4 is possible, is 1600x1200x1 feasible at 60Hz? What about
1200x1000x1 at 70+Hz? All without extra hardware? That matches the sparc thing
I'm sitting in front of that cost the university 3000 pounds!!

Environmentally Friendly...

680x0 Linux FAQ (TM)

[Now legal in 40 states]

ABOUT THIS FAQ

This FAQ is intended to provide general information on the 680x0 Linux port project which is currently underway. Mainly, it's an attempt to cut down on the flow of email that inevitably comes in every time I post something about the project. ;)

WHEN WILL 680x0 LINUX BE AVAILABLE TO THE PUBLIC?

I don't know. A couple months, maybe. We're working hard on it at this point, and advancing leaps and bounds (and a few stumbles). There's really no point to releasing the current system to the public. It's not useful, and only occasionally even mildly entertaining. ;)

WHAT IS THE CURRENT STATUS OF THE PORT?

We're still working on the basic kernel at this point. The scheduler, memory management code, interrupt code, filesystem code, and handful of drivers have been implemented. There's not much to see right now. The system comes up and goes through some of the startup process, then sits there and idles at you. ;)

WHAT PLATFORMS WILL IT RUN ON?

The Amiga port project is the only effort to port Linux to a 680x0 platform that I'm aware of. However, we are paying attention to portability where possible. It is our intention to cooperate with other groups willing to work with us.

I expect that once we make our first public release of the system, several groups will begin porting our sources to various platforms. Interest has been shown by Atari programmers, mostly. There are also a few people hoping to bring Linux up on Sun 3's. I haven't heard from many Macintosh folks. In all probability only the startup code, interrupt code, and drivers will need re-writing to get the system running on these systems, or any others with the necessary basic hardware.

I'm aware that the phrase "necessary basic hardware" begs some explanation. Simply put, that would be a machine with a 68020+68851, 68030 (non-EC model), or 68040 processor, at least a couple megs of RAM, a good amount of hard disk space, and obviously some form of text i/o device (i.e. you technically don't even need a display and keyboard if you can plug a terminal into it).

There _has_ been talk of a port that could run on non-MMU-equipped machines as well, though it would lack the obvious features inherent in a memory-managed operating system (e.g. true virtual memory, memory protection). There is currently no effort underway to implement such a system that I'm aware of.

HOW COMPATIBLE WILL IT BE WITH OTHER SYSTEMS?

We, of course, hope that 680x0 Linux will be compatible (at the source level) with 80x86 Linux, as well as many other Unix or Unix-like systems. Linux is POSIX.1 compliant, which helps quite a bit with porting software to it.

Binary compatibility with _any_ OS other than 680x0 Linux ports is highly unlikely.

WILL X WINDOWS BE AVAILABLE FOR 680x0 LINUX?

I get this question a lot, so I figured it's worth having its own section. The answer is yes... probably... eventually. ;)

At this point, we have one volunteer to port the mono server to the Amiga version of Linux once the system is stable.

WILL THE AMIGA PORT RUN UNDER OR EMULATE AMIGADOS?

No. Actually, the latter is a possibility, I guess.

WHAT ABOUT MACH?

There is a separate effort to port CMU's Mach kernel to the Amiga and other 680x0 platforms. I'm not really familiar with their work. We've only stolen a little code from them. ;) Anyway, our Linux port is not intended to run under Mach. It runs "on the metal".

CAN I BE AN ALPHA/BETA TESTER?

We're not currently at a stage where we need any testers. (See above under the section CURRENT STATUS OF THE PORT.)

IS THERE A MAILING LIST?

We have a channel on the Linux Activists Mailing List called '680x0'
for discussion of the port. Currently, it's rather quiet. However,
it's the "official" source of information on the system. On the
other hand, any important announcements will also be posted to the
newsgroups in which this FAQ appears.

For help in subscribing to the channel, send an empty message to
<linux-activists-request@joker.cs.hut.fi>.

Apple forced DR to remove overlapping windows and the trash can from the GEM *Desktop*.

>So I think the two GEMs have diverged. I think the only thing I've
>used PC GEM for is GemDraw. Is there even an Atari version of
>GemDraw?

Yes, way back in the early days of the ST. DR sold Gem Draw for the ST, but didn't put much marketing muscle into it. I think you could even get it on cartridge (I read that in some computer mag. at the time).

3508. Help! Atari ST sequencers for Yamaha PSS790 keyboard

Newsgroup: comp.sys.atari.st
Date: 1993-03-01 14:33:07 UTC
From: evilandi@vnet.ibm.com
Message-ID: <19930301.065436.228@almaden.ibm.com>
Source record: 209226
Cross-posted to: comp.sys.atari.st,comp.music

Many Atari ST sequencers that I use create a horrible "feedback/echo" effect on my PSS790 keyboard. When one note is played, it gets fed back and played over and over again, very fast. New notes merely add to the confusion.

The shareware program "Accompanist" seems not to do this, and works well. What cheap (ie. sub 100 UK pounds) commercial sequencing packages also work with the Yamaha PSS790 and Atari ST?

Alternatively, what fixes are possible to stop this annoyance on existing software? Thanks for any help.

Actually, I have seen many MORE configuration problems using PC's at work than with my ST system at home. This is mostly due to TSR type programs that must be loaded in a particular order to work properly (network drivers and the like).

3515. Re: ICD scsi commands group 1-7?

Newsgroup: comp.sys.atari.st

Source record: 209235

> I have a question, about the ICD hostadaptor for SCSI devices.
> Is it possible to send SCSI group 1-7 commands to scsi devices
> connected via the hostadaptor.

ICD has a program called SCSI.PRG, available with their Link/Pro
versions also available on GEnie. With this you can send commands
to your SCSI device. I have used this to send 10 byte commands to
my cd-rom drive.

ICD also has a set of object modules that allow you to write programs
that use their drivers. This module uses the Personal Pascal call
frame, but I have written a module that converts either the Pure C
ansi callframe, or the Pure C cdecl/gcc call frame to the Personal Pascal
call frame. I also check for supervisor mode. If you use their
modules in supervisor mode they will bus error, though after a little
hacking it was quite easy to fix this in my routine without switching
to user mode, and back.

The ICD package can be found on GEnie in the ICD area, and is called DMA.LZH.
It contains the object module, and the PASCAL include file.

My package contains the Pure C ansi module, the Pure C cdecl/gcc module
and the C include file. Source code not included.

If you want I'll send them to you.

Brian.

>friend's ST and it was the most realistic driving simulation I have seen
>anywhere, but it was just too slow, so I didn't buy it.

The most realistic driving game you have ever played? What a load of rubbish. The game is completely unresponsive and has so little artifical intelligence built in to the other players driving it is almost unplayable. For one, other cars do not seem to notice your presence, and quite often baulk you or turn into you when you are overtaking them, quite against formula one ettiquette. The game is also ridiculously easy.

>Somebody with a Falcon get hold of these please and try some games.

Work on a falcon? I doubt it. Bear in mind microprose have written their own disc operating system to work with the game, and are using custom graphics routines. It probably therefore will not work
~Giles

3518. What happened here ?

Newsgroup: comp.sys.atari.st

3519. Vector Graphic Programs?

Newsgroup: comp.sys.atari.st
Date: 1993-03-01 18:39:23 UTC
From: dlk0ms9s@umiami.ir.miami.edu
Message-ID: <1993Mar1.133923.14584@umiami.ir.miami.edu>
Source record: 209236

I am now in the market for a vector graphics program that also does bitmap work and auto tracing. After looking at several projects, I am currently deciding between Invision Elite and Silouhette. As I understand it from this week's Znet, TOAD Computers will be taking over support for Silouhette and it's new version which supports full color vector editing. Does anyone know of anyother porgrams that meet this type of versatility for the ST?

Right now I am leaning towards Silhouette Color because of the color support, but as a Calamus 1.09N/SL owner, Invision Elite could offer the support I would need. SUGGESTIONS?

Mark Santora

3520. Tos 2.05, Mega STE, Etc

Newsgroup: comp.sys.atari.st
Date: 1993-03-01 18:45:17 UTC
From: psurge@cs.utexas.edu
Message-ID: <lp4mdtINN1ci@levelland.cs.utexas.edu>
Source record: 209361

Ok, I have finally ordered a Mega STe. I used to have a 1040 ST, TOS 1.0 I have been told by the vendor that this STe has TOS 2.05, no HD disk (maybe, could be masquarading as a DD, though). Could someone please tell me the major differences between the two computers?

What is the major differences between TOS 1.0 and TOS 2.05? I am running pinhead, fatspeed, seralfix, and various other patches. Do I need to continue using these patches, or are somethings fixed. Are there any NEW patches I will need to run.

What are the major differences between TOS 2.05 and TOS 2.06? I have heard the formatting of HD disks is messed up, but the read and write of HD disks is ok. Are there signifficant differences in TOS 2.06 that would warrant $60 right now to get a set?

Finally, A friend just got a Mega 4 ST (no "e"). What are the differences between the Mega STe I will be getting and the Mega ST that he has (besides the SIMM slots, that is). I am talking ports and processor speed here. I also imagine he has TOS 1.4 in his machine. How much of a difference is TOS 1.4 and TOS 2.05?

I know this stuff has been covered before, but I suddenly find myself in the forefront of ST technology with the Mega STe coming from a TOS 1.0 1 meg ST and I don't know what my new machine will do.

Thanks for the info.

>>the Falcon IDE drive had to be. (Will any 2.5" IDE drive work, or does it
>>have to be Half Height (or less)?)
>
>Any 2.5" IDE drive will do. They only come in one size.
>

I was just wondering, because that didn't seem the case from the list I compiled off of clari.streetprices. Here's some of the listings (I took some out of the grep ";2.5 " list):

Conner CP2044 ; 42MB;IDE ;2.5 ;HH;23ms; ; 208;Quick Electronics ;(a)
Maxtor ; 80MB;IDE ;2.5 ; ;15ms; ; 219;HDSS ;(a)
Seagate ST9096A; 89MB;IDE ;2.5 ;1";19ms; ; 319;Quick Electronics ;(a)

As you can see, one is HH, one isn't given (I assume that it's either not known, or I'm supposed to take it as FH, I think it's "unknown"), and the last is 1". I know the list in .streetprices isn't complete, as the 65MB Falcon drive isn't listed (there isn't a 65MB 2.5" IDE drive on the list). Who makes the drive in the Falcon?

But, since a few people mailed me that all 2.5" IDE drives are the same, then maybe the list is in error? Is this "common knowledge" and thus could be wrong, or knowledge that you are sure of. I don't mean to question your authority (especially when it's competition is a stupid computer generated list, prone to typos, and mistakes) but am just trying to find out the deal here for those of us (like me) who really have no clue in this area.

Again, *don't* take this as an assult, I'd just really like to know!

For something simple like this, I would use Datamanager ST. There is also a DBase clone for the ST called DBman, if you need more power. Both of these products are commercial, and still available. Datamanager is great stuff, just point and click. I don't think I ever looked at the manual.

s>should be used to park the hard drive when transporting the Falcon.
s>
s>I've looked everywhere but couldn't find it.
s>
s>Any of the other falcon heads know know about this program?

Just forget about it, the falcons' hard drive parks automatically when power is turned off. (That's why they didn't include the software to do so...)

3526. Re: ICD HD SOFTWARE

>works on the Atari without the link connected, but you need the link to \
>connect to external SCSI stuff.

But what about ICD's Cleanup program? I bought Clean up when I
originally bought my ICD host adapter. When I got my TT (and moved my drives
over to the SCSI bus) it was no real problem until the Advantage board bit the
dust. Now I can't use the Cleanup software (even if I can use the boot
software, I still can't use the boot-configure tools without the Advantage
board working).

Does ICD plan to change this? Or at least allow cleanup and the boot
utils to work if it finds that HDboot has been loaded? I don't think I want
to pay $50 (the cost to have my board replaced) just so that I can run their
Cleanup software.

If anyone has a clue to sell/trade/loan me, I'd appreciate it.

Yup, that'll do the trick. They're suppost to be the 8bit (/chip ??) ones,
like the mac uses, but IBM ones seem to work in ST's too.

(BTW:Sorry for the illegal CR's in this message!)

(I think I'm the one "guilty" of bringing up the topic that there is a
Pascal to C translator. Others were aware of its existence, but I
think I was the first to mention it.)

Source code to "p2c" is available from a variety of sources, including
watserv1.waterloo.edu (129.97.129.140) in the directory
/languages/p2c. This is in SOURCE form, I would note. To my
knowledge, nobody has actually compiled it for the Atari ST.

Umm, the x1 would be one bit. That bit could be either on or off. So, no matter what the color selected would be, you could either turn it on or off. This would be a truely monochrome display. Of course, I'm sure you realized that after you posted ;)

[synclock description, other stuff deleted]

I forgot that PhotoChrome (and stuff like Spectrum) change pixels during the H-scan. However, couldn't you do palete switching during H-blank so that you get 256/16 colors per scan line, or better yet, buffer two screens (or more) and using persistance of vision tricks to expand the total number of colors seeable (isn't this how HAM works?). I believe that Howard Chu once did a small demo for the ST using this trick on a grey-scale of Marilyn M. If I remember write, it consists of: to display a color value of 8.5 (in any one of the colors R,G,B values) you show the color value 9 for two VSYNCs and the color 8 for one. Combining these tricks should give some nice graphics (although only good for picture viewing as this sounds fairly processor intensive).

>However, by shutting down ALL caches'n'stuff it *SHOULD* be possible
>.. and on a fast machine like the TT I believe that it would be able
>to put out those 32768 colours it CAN get, on almost any spot of the
>screen.

You might run into the problem where you can't modify a pixel at a certain location just _any_ time since you have to deal with the 250us time slicing of the video memory between the video hardware and the CPU. Since I don't know just how much control is necessary by the CPU, I could be way off here.

It seems like there's a weird bug in xcontrol that will just not allow
it to load certain cpx's. I know that when I first got the XCONTROL.ACC
program running, it would run the GENERAL.CPX and MACCEL.CPX's just
fine, but now it refuses to run them. I can activate them & deactivate
them as I like, and they show up in the "active" window, but they are
nowhere to be found in the main xcontrol selections menu. Why is this?

As a sidenote, this isn't exactly correct. You're limited by both the speed of the pixel clock and bandwidth to memory.

Just like the Amiga. Difference is, the Falcon supports "attachable pixel clocks", while the Amiga doesn't. The falcon's graphics are, in some ways, more flexible. But I'd say those would number in twos and threes. The Amiga's resolution-programmability is very advanced, far more so than the Falcon's relatively few capable resolutions.

Most sequencers have a midi thru option which sends the incoming data
back to the midi out. If you turn "Local" off on your keyboard then you
will hear what is being sent back from the sequencer (without echo) If
you cannot turn Local off then you will have to turn Midi thru on the
sequencer off.

Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of _humor_.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways), Emily has taken time out of her busy schedule to answer a few commonly asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.

Flame wars are fun. They're the main reason people creted Usenet,
and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV: ??.??.??
How do I become a developer for the Atari ST?
==========

Contact Gail Bacani, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5
Invalid handle.....-37.....6
Insufficient memory.....-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46.....15

No more files.................-49...........18
Range error...................-64...........33
Internal error................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

:FREE: ??.??.??
What is Free-Net and how can I get access?
==

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG

P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

CIS e-mail : internet>aa338@Cleveland.Freenet.edu

:MAGS: ??.??.??
What magazines are available for the Atari ST?
==========

If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.

As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby <kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011
Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so
polished. 2 cover disks per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't
have their names.

German Mags:

Atari PD Journal:

('Suspened' from publishing...)

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this
information, DP-Z]. Hardware and Software reviews, some commercial software
reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for
domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100
Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Bretonischer Ring 13, 8011 Grasbrunn, West Germany,
Phone: ++49 89 456 160

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French Mags:

ST Magazine

Monthly in French. Oriented towards developers, professional users. Comes
with a disk each month.
ST Magazine - 10, rue Hegesippe Moreau - 75018 Paris - France
(French Teletel users: 3615 Teletel access, code STMAG)

STart Micro

Monthly, includes a cover disk. 11 issues per year. 64 + 16 (separated) pages.
Price: FF38 per issue, subscription: FF360. Subjects: Desktop publishing,
graphics, initiations to C and GFA Basic, survey of outcoming software, music,
folders. Minitel access: 3615 code ATARI. Address: FC Press, 57 rue Danton,
92300 Levallois-Perret, France.

Dutch Mags

ST, published by Stichting ST , postbus 11129 2301 EC Leiden the Netherlands
---
cover price: fl 6,95
Independent magazine by and for atari ST users.
covers all different topics from applications to games and hardware.
60 pages.

6 times a year. One year subscription fl 35,-
black and white pages.

START, published by Divo , M. Gijzenburg 14, 2907 HG Capelle a/d IJssel
---
cover price: fl 7,50 (may be more now)
All round magazine, floppy-service available for published programs.
68 pages. 2 color print

6 publications a year. One year subscription fl 39,95
including floppydisk fl 119,95

Atacom, by Atari Club Groningen.

Never seen this one. I suppose you have to be a member of the club or so.
price is fl 4,95.
Adress of the club: Atari Club Groningen, Postbus 9164
9703 LD Groningen, the Netherlands.

Atari Nieuws, by Atari ST computer club Nederland

News paper sized publication. Lots of colour on newspaper pages. Not too many
pages though.
price is fl 3,95 (cheap cheap)
monthly publication.
adress: ACN, Postbus 5011, 2000 CA Haarlem, the Netherlands.

GFA-info, by GFA gg (usergroup)

Publication of the GFA-basic usergroup. This group has a lot of mainly
educational software available.
price is fl 5,00

adress: GFA gg, Frankrijklaan 14, 2034 BA Haarlem, the Netherlands

ST News, by Stichting Computers Eindhoven

This is an electronic magazine. It has been around for about 6 years now
and is completely in English!!! The first issues were in Wordplus format
back in 1986 but from the 6th issue on it included a readerprogram
both for color and monochrome. Even with music.
price is fl 10,00
adress: S.C.E., Kornoeljelaan 22, 5552 RC Valkenswaard

:TIPS: 93.03.01
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used
with the ST; the custom cable involves no tricks, or commercial ones are
available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are
tricky.

An ST-formatted disk which is not readable by a PC can be made readable by
putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning
of the boot sector (sector 1 of track 0, I believe). This can be done with
either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and
higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced
by ST formatters. On those drives, ST-formatted disks are not readable,
independent of their boot sector contents. The other way, however, does
always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access
a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick
extender cable will make life easier. The Y-cable joystick extenders make
it extremely easy to keep mouse and joystick connected to port 0, and a
joystick extender cable in port 1 makes for easy hookup after you've moved
the machine.

BARREL is a program which can redirect printer-data to a file. It comes in
handy when your printer is unavailable, and the program does not already
have an option to 'print-to-a-file'. (It is available on the atari.archive
server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to
drive B. Handy when a program 'hard-codes' the data drive, and you
wish to use your hard drive instead. (It is available on the atari.archive
server.)

On the Desktop, holding the right mouse button allows
you to manipulate files in other windows. This is useful for a number
of reasons. An example is this: say D:\BLAH.ARC is a file you would
like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then

hold the right button while double-clicking ARC.TTP in an inactive window.

:ZNET: ??.??.??
Where can I get copies of ZNET?
==============================

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR: ??.??.??
Where can I get copies of Atari Explorer Online?
==
Atari Explorer Online magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

Atari Explorer Online and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

:PD: ??.??.??
Where can I get Public Domain/Shareware software?
===

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@spud.hyperion.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu, jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

```
begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end
```

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions to INFO-A16 are also available on this server. INFO-A16 is a digest of messages from comp.sys.atari.st.

:FTP: 93.03.01
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)

Atari-related companies
==========

This is a (still under construction) list of companies and addresses that
might be of use to Atari ST users. Please send me addresses for the blank ones
on this list. See also IAAD, it lists many more companies that are not on
this list.

Berkeley MicroSystems
P.O. Box 20119

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Entries are dated by the last change. ??.??.?? means they were last changed
before the dates were added.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.
```

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS: 93.01.30
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC, .ZIP and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ZIP Use UNZIP.TTP or STZIP.PRG
ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

stzip21.lzh - STZip, with GUI interface

unzip41.lzh - Old version of unzip

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using
zoo21.ttp.

:MSA: ??.??.??
Some info on Magic Shadow Archiver
==================================
(This was provided by Chris Herborth)

MSA Archives

The Magic Shadow Archiver (MSA) is a disk archiving program that allows an entire disk to be compressed into one file for transmission. The Magic Shadow Archiver (in shadow.[arc?|lzh?|zoo?] on atari.archive.umich.edu in ~/Archivers) creates .MSA files, which are often compressed using a normal archiver, such as zoo or lharc.

Magic Shadow is notoriously bad when used on a 1/2 meg ST and only one floppy drive. Its disk access and memory use are very badly thought out, and could result in over 160 disk swaps when unpacking an 80 track, double-sided disk.

Due to the fact that it was the _only_ disk image archiver around for quite a long time, Magic Shadow is the de-facto standard for creating disk images of computer demos and other pieces of software that cannot be easily compressed as files.

Because MSA files are disk images, they can only be used to recreate a floppy disk. There is (currently, see below) no way to extract the files from an MSA archive without writing it to a floppy disk.

Magic Shadow works perfectly with any legal TOS floppy format, even high density disks found in modified STs and most MegaSTes and TTs.

Chris Herborth (herborth@pinot.waterloo.ncr.com at work,
cherborth@semprini.tdkcs.waterloo.on.ca at home,
C.HERBORTH on GEnie) is writing a much more efficient MSA extractor, called UnMSA. UnMSA will minimize the number of disk swaps, and speed decompression considerably.

Daryl Richards (no email address, yet) is working on an MSA-Mounter, which will allow someone to unpack an MSA archive to RAM or a file on a hard disk. This uncompressed disk image will then be added to the system as a logical drive (much the same way a RAMdisk adds a drive to the system). MountImage on the Mac is an example of the way MSA-Mounter will eventually work (MountImage is so good, you can install new versions of the Mac OS using floppy disk images stored on your hard drive).

:CLI: ??.??.??
What Command Line Interpreters are available?
===

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6

```
Unknown media...................-7
Sector not found................-8
No paper........................-9
Write fault.....................-10
Read fault......................-11
General error...................-12
Write protect...................-13
Media change....................-14
Unknown device..................-15
Bad sectors on format...........-16
Insert other disk...............-17
Invalid function number.........-32............1
File not found..................-33............2
Path not found..................-34............3
No handles left.................-35............4
Access denied...................-36............5
Invalid handle..................-37............6
Insufficient memory.............-39............8
Invalid memory block address...-40............9
Invalid drive specified.........-46...........15

No more files...................-49...........18
Range error.....................-64...........33
Internal error..................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs
=========================================
Reset: Initial PC2..............1

User Interrupt Vectors......64-255
```

```
:GDOS: ??.??.??
What is GDOS, and where can I get it?
====================================
```

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available commercially from Atari. It is currently included with WordFlair II. FSMGDOS uses scaleable fonts - you do not need to create a font file for every point size. Current word is that the street price for FSMGDOS will be about $50. The Lucida font family comes with FSMGDOS, and the output is very nice, even on a 9-pin Epson printer. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

```
:GNU: 93.01.30
What GNU software is available for the ST?
=========================================
```

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.3.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM: ??.??.??
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX

Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG: ??.??.??
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the Atari ST. Programmers seem to flock to the Atari ST, and if you know of a language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME
SIOD
Smalltalk
XLisp

XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX: ??.??.??
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT: ??.??.??
What is MiNT?
==========
MiNT is a free multitasking operating system extension for TOS. It is somewhat like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM

program along with a lot of character-based programs simultaneously. MGR and MW2 can both put multiple terminal windows on screen, and bgacc can put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go with it can be found at atari.archive.umich.edu:/atari/mint.

TOSWIN is the new replacement for bgacc: it provides lots of nice features like variable fonts, menus, selectable window gadgets, etc. GEMTERM is a similar package (it's not part of the standard MiNT distribution) modelled after TOSWIN and XTerm.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now 'MiNT is Now TOS'. :-)

:XWIN: 93.03.01
Is there a version of XWindows for the ST?
==========

There actually is a port of XWindows to the ST now, although it is pricey. Here's the (slightly hacked up) announcement for it:

X/TOS/window/server and X/TOS/window/server/color

Vendor:
X/software Michael Gehret
X/TOS division
Marktstrasse 8
W-8944 Groenenbach
Germany
TEL: +49 8334 1411
FAX: +49 8334 6245
email: xtosinfo@xsoft.uucp
CPU:
Atari Mega ST, STE, TT
68000 to 68040
Memory:
2 Mbytes (4 Mbytes recommended)
Operating System:
TOS 1.4 or higher
Mouse:
Atari mouse
Graphics:
X/TOS/window/server:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
X/TOS/window/server/color:
monochrome 640x400x1,
monochrome 1280x960x1 (TT, SM194)
color 320x200x4
color 640x200x2
color 640x480x4
color 320x480x8

Ethernet Card:
Atari Card (Mega or VME bus)
Riebl/Wacker (Mega or VME bus)
Biodata BioNet 100 II (DMA port or VME bus)
Network Software:
Atari/Riebl/Wacker ANS TCP/IP
Biodata TCP/IP
Disk Space:
none (two floppy disks, may load fonts from second disk or font server)
Features:
full X11 Release 5 implementation
Shape, Multi-Buffering, MIT-SUNDRY-NONSTANDARD extensions
PEX extension optional
support of font server protocol
support of X Display Manager Protocol
access control support
compatible to OSF/Motif and OpenLook
high performance (more than 32,000 Xstones on TT)
fast cursor tracking
backing store and save unders support
size of virtual screen limited by memory only, automatic panning
X/TOS/window/server/color supports all video modes at the same time,
including dynamic visuals
loadable key maps (xmodmap format), full support for European keyboard
layouts
3-button mouse emulation with Atari 2-button mouse
may run parallel to GEM (switching with hot key), configurable multi
tasking priorities
about 50 fonts supplied

:DEMOS: ??.??.??
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably
need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from
atari.archive to allow this.

:PAINT: ??.??.??
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD: ??.??.??
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---

send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP: 93.03.01
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu.

:TEX: ??.??.??
Is TeX/LaTeX available on the Atari ST?
=======================================

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The
latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0.
This consists of 8 disks full of TeX stuff, plus an installation program
that takes care of the details for you.

==
Hope you liked the comp.sys.atari.st FAQ. If you have comments,
suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Later,
Steven Ourada

Cross-posted to: comp.sys.atari.st,comp.answers,news.answers

```
Archive-name: csas-faq/part3

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Entries are dated by the last change. ??.??.?? means they were last changed
before the dates were added.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

WEL Welcome to comp.sys.atari.st
MODELS All the models in the ST line
FALCON What are the specs on the Falcon?
ACCEL Hardware Accelerators
DRIVES What should I know about hard drives and the ST?
FLOPPY Can I use 1.44 meg floppy disks?
GRAPHIC How can I enjoy enhanced graphics on my ST?
JOY What joysticks work best with the Atari ST?
MODEM What modems work with the Atari ST?
MONITOR What should I know about monitors and the ST?
PCEM How can I turn my Atari ST into a PC emulator?
SPECTRE How can I turn my Atari ST into a Macintosh emulator?
UPGRADE Can/should I upgrade my ST?

:WEL: ??.??.??
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
```

comp.sources.atari.st ! uuencoded/shar sources

:MODELS: 93.01.30
All the models in the ST line
==========

This is a pretty complete list of all the ST/TT models and their main features. If you have any additions/correction, of course, send them to me.

Feature key:
CPU's:
8 8 MHz 68000
16 16 MHz 68000
16/3 16 MHz 68030
32/3 32 MHz 68030

RAM:
/1 128kB
/5 512kB
1 1MB
2 2MB
4 4MB
S SIMM slots for expansion

Built-in:
F Floppy
M TV modulator

Extra:
AV 8 bit digital stereo audio, 4096 colors, hardware scrolling, analog joystick ports
MB MegaBus processor-direct bus slots
6U 6U VME bus slots, second serial port
FC Motorola 56000 DSP, 16 bit stereo audio, much enhanced video

TOS:
Highest built-in TOS

Models:

Name	CPU	RAM	TOS	B.I.	Extra	Comment
130 ST	8	/1	1.0	M		Never marketed
260 ST	8	/5	1.0	M		
520 ST	8	/5	1.0	M		
520 ST+	8	1	1.0	M		
520 STm	8	/5	1.2	M		
520 STfm	8	/5	1.2	FM		
1040 ST	8	1	1.0	FM		
1040 STf	8	1	1.2	F		
1040 STm	8	1	1.2	M		
1040 STfm	8	1	1.2	FM		
Mega 1	8	1	1.2	F	MB	

Mega 2 8 2 1.2 F MB
Mega 4 8 4 1.2 F MB
STacy 8 1 ??? F Laptop
STBook 8 1 ??? F Notebook
520 STe 8 .5S 1.62 FM AV
1024 STe 8 1S 1.62 FM AV
Mega STe 16 1S 2.06 F AV,MB,6U
TT 16/030 Just for developers
TT 32/030 S 3.06 F AV,MB,6U Various mem/HD configs
Falcon 16/030 S 4.?? F AV,FC Many enhancements!

:FALCON: ??.??.??
What are the specs on the Falcon?
==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

:ACCEL: ??.??.??
Hardware Accelerators
=====================
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)

Full size version

:DRIVES: ??.??.??
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:

```
-------------- ----------- ------------ ----------
| MFM drive |------->|ACB 4000 |------>| ICD |------>| ST DMA |
-------------- ----------- ------------ ----------
```

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put
the drive internally, you will need a case with power supply to house the
adapter and hard drive. IBM case is very easy to get and has a lot of space
for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive
they use about 20 watts or less, Quantum LPS drive use about 10 watts each,
make sure your power supply has more than the drives need. Again if you
use IBM case, the 150 watts power supply for that type case can drive at
least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL),
it's 50pins IDC female connector on each end with 50 conductors
cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be
available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again.
And check the jumper setting on the drive (consult the drive's manual). If you
are using more than one drive with the system, make sure only the last drive
has the terminator (either a DIP or a signle inline package of resistor, which
usually is socketed and close to the SCSI connector on the drive circle board.
Remove the terminator from other drives. [only the last drive should have the
terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5
from ftp sites.

:FLOPPY: ??.??.??
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe
and TT machines. If you own an older Atari ST, there is a company which offers
a $199 kit (including floppy) to install and use the drive. (I will supply
the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the
desktop.

:GRAPHIC: ??.??.??
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by Ben Gilbert
and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync

monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Here's a few more cards, available from OverScan GbR, Saentisstrasse 166,
1000 Berlin 48, West Germany, ++49 30 721 94 66, ++49 30 721 56 92 (FAX),
++49 30 727 05 6 (Mailbox, language: German)

Autoswitch OverScan for the ST (NO STE compatibility) is DM 129.--, you
don't have to buy a new monitor. The maximum resolution on a SM 124
is variable, but in most cases at about 732*480.
AutoSwitch OverScan TT is a VME board. It's about 249.-- DM, you also can use
your old monitor, but it only works in the TTs five color modes
(3 ST-compatible modes, 2 TT-modes). Resolutions are variable, ask
OverScan about the values for your monitor.
Falcon ScreenBlaster blows up your Falcons resolution to a maximum of nearly
900*600 on SVGA-monitors. It'll be shipping as soon as Falcon030s
become available, and the pricing will be near 150.-- DM.

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY: ??.??.??
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM: ??.??.??
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

You will probably need a serial port patch program to use high speed modems on your ST; most versions of TOS have a bug in CTS/RTS handling.

:MONITOR: ??.??.??
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM: ??.??.??
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE: ??.??.??
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases.

The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM

binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE: ??.??.??
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

There might be; then again, because of the licencing fees you have to
pay BitStream for using Speedo fonts, there might not be.

That's right; Atari picked one of the font formats that there are NO
freeware/shareware/etc fonts available in. Paying Apple $$$ to be able
to use TrueType would've been a much better idea; paying Adobe $$$$ for
ATM would've been brilliant.

I recently bought a modem with fax capabilitites, and was wondering if there was software (PD preferrably) to utilize the fax. Also, any suggestions as to the best PD communications software to use (I'm using uniterm right now and it seem s to work pretty good...file transefer is really slow though, is there any way to speed it up?) My modem is a 2400bps ZoomFax from AFX.

Thanx!

CAD-3D is still available (I bought it from an Atari dealer about 35 minutes' drive from here, also check E. A. Brown and other catalogs), but there is another originally-Antic program that's a better modeler: Cyber Sculpt. It has more primitives, tools, etc. - far more powerful. However, it does not do rendering. As far as making animations goes, you'd be better off using Chronos-3D (from Lexicor) than CAD-3D. (Chronos does not let you create 3D objects, just render and animate them. Cost is about $200 though.) Both Chronos and Cyber Sculpt are available from dealers or directly from Lexicor Software Corp., 58 Redwood Rd., Fairfax, CA 94930 (415) 453-0271

Oh, yes - CAD-3D and Cyber Sculpt use the same .3D2 object file format. Lexicor has another program (Rosetta-3D) which can translate to and from other platforms /formats.

Not being a linguist, I still doubt this: British English is a european language and its pronouncing is much closer to other european languages than American. So I assume that this type of pronunciation (I call it "cleaner" :-) has some tradition in Europe and thus necessarily also for longer time.

Errm, sorry there are FIVE ST magazines that I can think of

Atari ST User
ST Format
Atari ST Review
ST Action
New Atari User(formally Page 6 - covers 8-bit as well)

Also, I'd like to point out that, Falcons ARE available in the UK. I've ordered
mine, and it turns up tomorrow.

3560. *.avs player for Falcon

Newsgroup: comp.sys.atari.st
Date: 1993-03-02 12:13:36 UTC
From: kgrubb@cee.hw.ac.uk
Message-ID: <1993Mar2.121336.20344@cs.hw.ac.uk>
Source record: 209257

I was wondering if anyone out there has a *.avs player for the Falcon, or knows where I can get my hands on one, as I have a couple of large (5Mb and 20Mb) .avs files which I have viewed on a PC with a PCTV add-on card. But I would like to see them on my own machine. Any help would be much apreciated.

Thanx, Kevin.

3561. Two player/computer games via RS232

3563. Diablo emulator question

Newsgroup: comp.sys.atari.st
Date: 1993-03-02 13:36:00 UTC
From: marc@targon.UUCP
Message-ID: <2938@targon.UUCP>
Source record: 209272

I'm using the diablo emulator already for some time now, but I still
don't understand how one could use the ability to load more than
one font. Can those additional fonts only be selected from self-written
programs or what?
Anyway the diablo emulator suffers from the typical lack
of documentation one is used to of atari products. All I found
on the masterdisks was a document telling what had changed
since earlier versions.
Has anyone more information about how to interface to the emulator?

marc(@targon.UUCP)

3564. FALCON availability

Newsgroup: comp.sys.atari.st
Date: 1993-03-02 13:39:00 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <2MAR93.08390039@cc4.crl.aecl.ca>
Source record: 209251

In a recent exchange of info with Atari, I was told to just keep hanging in while the "new dealer terms" are worked out. I have no idea what this means.

My business was slashed as consumers wait for the FALCON and all I have to hold on to is a request to be patient and to wait for undefined new dealer terms.

Kind of makes me nervous.

I would have preferred to have Atari wholesale its products through Merisel; I get my products next day from Toronto. Currently, I am looking at 2 weeks minimum from California. I have waited OVER three months for a replacement 1.44 meg drive for a TT warranty repair. It is VERY hard to market product for a company that has such a hard time getting product into the resellers hands!

Yeah, it's on display but none for sale yet. Only developers have been able to
buy units in the U.S. so far. I saw one myself when a developer brought it to
my user's group meeting. Yeah, it's real and it's a great machine compared to
my dinosaur 1040. Talk about agonizing waits.

3567. Re: Running Nethack 3.1 in 1 MB - now for the good news

Newsgroup: comp.sys.atari.st
Date: 1993-03-02 14:42:32 UTC
From: christof@wowbagger.pc-labor.uni-bremen.de
Message-ID: <1993Mar2.144232.17081@informatik.uni-bremen.de>
Source record: 209398

It seems I was too pessimistic after all about getting nethack 3.1 to work in 1 MB. By leaving out several of the optional features of the game (the most important of those we left out are TOURIST and POLYSELF; we did _not_ sacrifice MULDGN, however) the binary could be reduced to 850 K. I tried it on a 1040 with no harddrive and it worked (even Ice- or Jam-packed!).

Despite this success, we aren't going to release this yet as 3.1.1 is already out and we don't want to release a version that would be obsolete from the start. Furthermore, there are one or two bugs in the 3.1.0 sources that only become apparent if the game is compiled with some of the configurable options left out. I don't know whether these have been fixed for 3.1.1, if not, we'll mail them to nethack-bugs@linc.cis.upenn.edu first, as we don't believe in unofficial patches to be the Right Thing.

So the bottom line for all you 1MB nethackers is: it's definitely possible and we _will_ release it. The only drawback is that it will probably take one or two more weeks.

In article <1993Feb27.170115.5336@prime.mdata.fi> paetau@mits.mdata.fi (Rasmus Paetau) writes:

>
>BTW, any news on when the next patchlevel is going to be ready?

|> Thanks for all the clarifications. The Amiga1200 videohardware
|>is also freely programmable. NOw my question: what is the bandwith
|>of the falcon's graphics chip to the memory?

I do not know anything about the amiga's hardware so i don't talk about it. I am
no amiga or xxx-flamer, i told you only facts. Your question: I do not know
the exact bandwidth because ATARI didn't tell it to me. But I know that at
least 20MB/s must be possible (I've seen that) and I also know that 48MHz
pixelclock at 16colors are not possible (that would be 24MB/s). But it seems
the border is closer to 24MB/s than to 20MB/s because the picture was not totally
scrumbled at 48MHz. I hope this answers your question.

What I would like to know: What bus bandwidth has the A1200?

matt-dah@dsv.su.se (Mattias Dahlberg) wrote:

|>I'm sitting in front of that cost the university 3000 pounds!!
I did not promise that because we've not done that.
Hey STOPSTOP!!! I didn't say that "all without hardware"-thing! For higher
pixelclocks you need an external clock! Internally there are only 25 or 32 MHz!
Some of my resolutions only work with my own high-pixelclock solution. We are
also planning to sell it after we've done our next tests. Our price should be
lower than that of others, because we have a simpler solution.

neurom@stein.u.washington.edu (Neuromancer) wrote:
Oh, I don't copy THAT one. He already got correct answers...

|>is possible. However, as you rightly point out this would be useless, even if
|>quite big.

Fine calculation, really! But you should know: You cannot increase the pixelclock freely!! ATARI officially does not speak of more than 32MHz, which of course does not prevent the Falcon from being able to do more than that...

>have been told by the vendor that this STe has TOS 2.05, no HD disk (maybe,
>could be masquarading as a DD, though). Could someone please tell me the
>major differences between the two computers?

What you just bought is the early version of the MegaSTe with TOS 2.05 and DSDD floppy. I've got one just like it. I'm sure you will be thrilled with the increased speed and ease of use of your 16MHz MSTe compared to your old system.

>What is the major differences between TOS 1.0 and TOS 2.05? I am running
>pinhead, fatspeed, seralfix, and various other patches. Do I need to continue
>using these patches, or are somethings fixed. Are there any NEW patches I will
>need to run.

TOS 2.05 (and 2.06) give you a TT-like desktop with a lot of very handy features. I particulary enjoy the user-definable keyboard which allows you to program one key to perform desktop functions like create a new folder and a function key to execute a user specified program. Lots of nice goodies like that. I'm still running pinhead on my system but no other patches. And while the file selector Atari implemented with TOS 1.4 is a great improvement over the one in 1.0/1.2, it still cannot compare with the convenience of Universal Item Selector III.

>What are the major differences between TOS 2.05 and TOS 2.06? I have heard the
>formatting of HD disks is messed up, but the read and write of HD disks is ok.
>Are there signifficant differences in TOS 2.06 that would warrant $60 right now
>to get a set?

Hmmmm... I didn't know there was a problem with using HD disks with TOS 2.05. Maybe someone else here can elaborate. The major difference, I'm told, is that TOS 2.06 is downward compatible with other systems, i.e., 1040STe. I have another system with an HD floppy and a Gemulator with TOS 2.06 so I haven't felt the need to upgrade the TOS 2.05 chips in my MSTE.

>Finally, A friend just got a Mega 4 ST (no "e"). What are the differences
>between the Mega STe I will be getting and the Mega ST that he has (besides
>the SIMM slots, that is). I am talking ports and processor speed here. I also
>imagine he has TOS 1.4 in his machine. How much of a difference is TOS 1.4 and
>TOS 2.05?

Loads of difference. The MegaST uses TOS 1.2 which is nearly identical to TOS 1.0. Your MSTE has multiple serial ports and the VME port and a 16MHZ 68000 vs the MegaST's 8MHz cpu. There is more room inside the MegaST case for expansion. TOS 1.4 was a _great_ improvement over TOS 1.0. I feel that 2.05/ 2.06 is an equally great improvement over 1.4.

>I know this stuff has been covered before, but I suddenly find myself in the
>forefront of ST technology with the Mega STe coming from a TOS 1.0 1 meg ST
>and I don't know what my new machine will do.

I'm sure you will enjoy the MSTE. I once termed it "the TT for the rest of us"
in an early magazine review of the machine. You may experience some software
incompatibilities, particularly games. If so, first try turning off the cpu
cache (via the control panel) and then try disabling the extensible control
panel itself. This usually takes care of most problems, if any occur.

Cheers!

Note: My apologies to others since this should have been answered via email.

Carlos, CYBERDROME-THE HOVERJET SIMULATOR was designed from the start as a two-player/two-computer simulation using modems (up to 9600 baud) or a null modem cable. It also has a single player mode for the times when you cannot find a partner. This is commercial software, however a fully playable pd demo is available on atari.archive.umich.edu as well as GEnie and CIS.

Did I mention that it is compatible with the TT and Falcon030 too? :)
Please send email if you would like more detailed info.

Atari Works has a database that looks just like that in its Table mode.
Should be out in a couple of weeks, surely by April 1 (no joke).

I seem to remember that the "Pet shop boys" used to use an Atari, are they still going these days?

Also Mike Oldfield uses an Atari, remember Tubular Bells? I'm sure I've seen a number of other 'musical' groups with the words Atari ST in the album covers. Still, they may well have moved onto other machines since I last checked. It really depends on the mentality of the musicians involved, you have to bear in mind that most 'people' ie the man on the street, are pretty computer illiterate and if they see the words 'midi interface as standard' on the box then well, its bound to nudge them in the right direction. Thats my opinion anyway.

3583. the drop of the ste

Newsgroup: comp.sys.atari.st
Date: 1993-03-02 18:55:35 UTC
From: aesd1pak@dct.ac.uk
Message-ID: <1993Mar2.185535.4137@dct.ac.uk>
Source record: 209265

I hear from one off the st mags (ATARI ST USER) that atari have finished producing STE's.
I find that atari have shown a lack of support for the computer.
They are now only doing the falcon and it seems the TT has been axed as well.To increase this point atari said last year that they were producing software for the STE only but were is it.
Atari have failed to support the 900000+ ST owners in the UK and also the hundreds of thousands of users world wide.

SHOULD we let atari continue with thier attitude to drop there support for these great machines or should we do nothing and see how the FALCON will do.

PIP

3584. VGA modes. Was: What res is VGA?

Newsgroup: comp.sys.atari.st
Date: 1993-03-02 19:11:53 UTC
From: darekm@microsoft.com
Message-ID: <1993Mar02.191153.7560@microsoft.com>
Source record: 209279

In article <1mjv7kINNst6@golem.wcc.govt.nz> wells_s@kosmos.wcc.govt.nz writes:
>I thought 640*480*256 was a VGA mode, not a Super-VGA mode!?
>(As, we have VGA machines, which seem to use 640*480, and it says
>(and looks like) 256 colors!)

The standard VGA mode common to all VGA cards is 640x480 in 16 colors
and typically that's all you'll get out of a 256K VGA card. It's a
standard video mode ($11) that any VGA compatible PC BIOS will give you.

VGA mode is also identical to what on the TT is called "TT medium" resolution.
That's why you can take Windows bitmaps and display them on the TT and
vice versa, since it's the same mode. That's why Gemulator provides the
ability to run ST programs in TT medium rez - the modes are the same.
<shamelss plug>

The 4096 color palette on the ST/TT is less than on VGA (since they use only
12 bits of RGB values instead of 18 bits on VGA) but that's a minor point.
I think this whole argument over 16 million colors vs. 65536 color etc. is
all nit picking. When someone shows me why I need 16 million colors to
edit text, I might be more interested.

Anything above 640x480x16 is typically called SuperVGA, although there
isn't really any standard that all PCs use. If you write software for
"SuperVGA" you're pretty well stuck with writing your own driver for each
different VGA card, or more accurately, each different chipset that the
various cards use.

There is the VESA standard, which just means that the card manufacturer
provides a driver that adds certain predefined video modes to the video BIOS.
Those are typically 800x600 and 1024x768 in 16 and 256 colors. Most but not
all cards are VESA compatible I think. I'm not too up on that.

When you go from 16 to 256 colors you double the memory requirements, so
640x480x256 requires a 512K card. 1024x768x256 requires a 1 meg card.
I think 800x600 can get away with using the same amount of RAM as 640x480,
since 640x480x16 requires 150K of RAM and 800x600x16 requires 240K of RAM.
Either way chances are you have 256K of RAM on the card.

Now if you want to talk about monitors, you've got your standard el
cheapo $200 VGA monitors tha ONLY do 640x480 at some fixed refresh rate.
Stay away from those monitors. Then you have "multiscan" monitors like
the ones that Gateway sticks you with, which are multiple frequency
monitors capable of handling 640x480 and 800x600 and 1024x768 but only
at specific refresh rates. Different VGA cards have different refresh
rates (60 Hz, 72 Hz, 56 Hz, etc) so not all VGA cards with work with all
multiscan monitors without major hassles. Then you have the true

"multisync" monitors, like the NEC 3D, 4D, 5D monitors. They can handle
pretty well any signal you throw at them. If you're getting a fancy
VGA card, get that kind of monitor and save a lot of headaches later.

Hope that helps.

[stuff deleted]
>I seem to remember that the "Pet shop boys" used to use an Atari, are they
>still going these days?

I don't know if the band itself still makes music, but the lead
singer was part of the group "Electronic" (with a member of "New Order"
and some others). With the style of music, I imagine an Atari could
have been part of the mix...

Come to think of it, the song "The Crying Game" (from the movie?)
was produced by the Pet Shop Boys (if I heard the radio station
correctly; the song itself is performed by Boy George, of all people)...

Also, I think "The KLF" ("Justified and Ancient") possibly used
ST's in their studio work...

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...hmm, ST and TT are nice and short terms, maybe F3 would be a good
abbreviation for te Falcon030? (definitely is easier to type)...

3586. Need backup disks for MIDIMouse Music

Newsgroup: comp.sys.atari.st
Date: 1993-03-02 19:32:05 UTC
From: L695819@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <93061.41525.L695819@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 209275

One of my favorite sets of applications for my Mega STe are a series of MIDI instructional programs entitled "Note Wizard", "Scale Master", "Rhythm Time", and "Chord Magic". These applications were put out by MIDI Mouse Music of Oregon. Unfortunately, they are no longer in business, so I can't get backup disks. And with these applications, the user must always have the original, or "key" disk in drive A in order to boot up. The "key" disks are fairly interchangeable between theree of the applications, but unfortunately, I managed to wipe out two of them, which means I only have one left. ("How did he do that?" you ask. What I did was start up my STe with the power turned off on my external drive "B". As STe users with a drive "B" know, when you do that, you get a message screen saying that your disks drives don't work. So you shut off the computer, turn the power of drive "B" on, turn your computer back on, and away you go. But if you leave a disk in drive "A" while you are doing this -- BAD NEWS|) I learned this lesson the hard way, and now a couple of my disks won't act like "key disks". I have tried making a backup copy with "Pro Copy", and took the disk to B and C ComputerVisions in Santa Clara, CA, and they couldn't make me a backup either. So what this means that I have only one good key disk left, and if I screw that one up, (which I am trying to avoid doing), I am out of luck with my favorite STe applications. Short of buying the entire set again (and there's only one store I know of that even has copies left), is there anyone out there who can help me? Does anyone know how to get hold of the developer for backup disks? Does anyone have a set they would like to sell cheap? Please reply on the Net (not E-Mail), or call me at the following number. I will return the call. Thanks in advance. Mark van Wyk, (408) 739-0541.

>from evaluating the status byte response to a read command, you're out
>of luck, and that's probably why ICD says it can't be done. If you
>have additional error checks in your driver, everything will work fine.

In this case the 'driver' software in question wasn't a vendor-supplied
driver. I verified this situation with my own code, which accesses ACSI
devices directly through the DMA chip. (I wrote a program that can backup
and restore non-DOS parts of a hard drive, such as the partition boot sectors,
badsector data, and partition map. It can do so without the presence of a
normal device driver, because your normal driver probably won't boot if
physical sector zero on the HD has been zapped.)

My program verifies the Tandon's behavior not just be checking the status
code from a seek or read operation, but by actually performing disk I/O
successfully. For example, I can backup the partition map by asking for
LUN 0, then format the drive specifying different partition sizes, then
restore the old partition map to LUN 1, and the drive successfully
returns to the old partition sizes.

Hi! I was wondering if anyone is interested in collaborating on some polygon drawing routines in assembly.

I already have putpixel, horizontal line, and fillscreen functions.

the thing is, they're not that fast. and for now, i use a C polygon drawer that calls the horizontal line routine.

for those who would gripe about compatability, the final step is a vro_cpyfrm, which places it into the correct screen area.

anyone interested? I also have a 3D->2D conversion library if that could be used in "trade".

thanks, just reply via email.

Since I'm in a good mood tonight I thought I'd share this little bit of information with the rest of you guys. While reading the rather more intersting Maus news from germany (compared to the recent stuff on here that is) I came across this: (translated to english (well.. my kind of english) for the benefit of those who can't read the official Atari language):

Olaf_Mootz says something like: " I have just been on the phone to GE Soft blah blah blah they are working on a card for the Falcon!! Without second level cache but with additional FASTram (upto 32MB) and using 32Mhz! To be displayed at CeBit"

This should cheer up those (including yours truly) who weren't too happy about the speed of the Falcon.

Cheers,

Torbjoern

John,

Funny you should mention this and I should read this message tonight! I just
received my first order from TOAD Computer today (An ADSCSI Micro) and it came
with a "sample" issue of Current Notes (from Sept.1991 -- not so "Current" :-)
that had this reveiew of the Mega STe. I just read that review a few minutes
ago and didn't even link "John Hutchinson" with you, John Hutchinson! Heh!

Small world....(??)

I've been using Gribnif's Arabesque Professional for a couple of months, and so far it seems fairly good. It does NOT offer color support, but it does import CVG files (although the manual seems a little dubious -- I haven't tried it myself). According to the November 1992 Gribnif newsletter, you can get Arabesque direct from them for $129.

Hope this helps!

Paul says:
>O.K. boys and girls, It is now March 2. Were is the U.S. version of the
>FALCON????????? Any U.S. sightings? (as if...)
> Paul
>

Well, I _doubt_ very seriously that it will be on time, because as you can see it isn't. Someone recently posted a thing about ATARI dropping all support for their computers except the falcon. If they do that it just proves that the Tramiels know nothing of good business practice. I own a TT and although I am marginally satisfied with it I am wholeheartedly disgusted with the support I have gotten.

If MultiTos ever is available, and it works correctly I might change my mind though. :)

Also, for you two gentlemen that posted about your SPICE products, I am interested in getting them even with German documentation, so perhaps you could post some prices and where to send to get them. The products were Spiceline and something else...

Thanks.

3607. Re: the drop of the ste

Newsgroup: comp.sys.atari.st
Date: 1993-03-03 02:55:12 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1n16mgINN34m@golem.wcc.govt.nz>
Source record: 209288

] SHOULD we let atari continue with thier attitude to drop there support
] these great machines or should we do nothing and see how the FALCON will

Nothing we can do, Atari has never really cared about the general public.
They just run a business that makes/sells machines & software!

There was only ever maybe 5 commercial titles that were STE-ONLY!
(May be more, but that seems like about all I can think of), and not
many more that supported the hardware.

The STE is the 286 of the Atari world, it was the standard a couple of
years ago, the Falcon is the 586 of the Atari world, the (to coin
a phrase) kick-ass machine to 'beat them all' the *new* standard.

The problem is, the Falcon has little compatibility with the STE, whereas
the 586 is essentially the same as the 286, but with a lot more
speed+power! (A lot more.... but we'll see)

There's not a lot anyone can do. But, the Falcon looks like being a
nice little machine, as long as Atari gets their act together!
(Like, not charging huge amounts for upgrades of buggy ROM's etc.,
advertises properly, make sure the packaged software is pretty much
bug-free - and fast!) But, unless something horrible goes wrong, Atari
looks like they might actually get a competing machine onto the market
for a change! (won't make much of a dent in the PC-world, but it's
bound to sell!)

3608. Re: Tex 4.0 HELP!

>Tex enthusiasts out there who have text files on " Tex for beginers" or are
>prepared to enter into email conversation on the subject?
>Any help will be appreciated.

Depending on what you're after, I'd suggest these information sources:

a) Comp.text.tex
- The newsgroup that is devoted to TeX/LaTeX. There are lotsa
questions asked, and lots of answers. Look at the FAQ lists BEFORE
posting, because it's a fairly high-traffic group, and it's not worth
Yet Again Rehashing the classical problems.

b) The TeXBook, by Donald E. Knuth/LaTeX User's Guide & Reference
Manual by Leslie Lamport.

The LaTeX book is on my desk even as I write; if you want to actually
USE TeX/LaTeX, it makes sense to obtain a copy of the REAL manual.
Both books are published by Addison Wesley, and are available at
better university/computer bookstores.

c) There's some guides floating around - not being a beginner, I
haven't been keeping track of 'em. They're listed in one or the other
of the Comp.lang.tex FAQ lists.

d) If you have some particular questions that relate directly to
getting CS-TeX running, you've definitely come to the right newsgroup.

It's not difficult to get set up - the defaults are really quite good.

There are some defaults that you may have to fix, though, depending on
your system configuration. For instance, your favorite printer may
not be the one that CS-TeX defaults to. It's not hard to get that
fixed.

In addition, you probably have to get it to "Generate Formats," and
which ones need to be generated depends on what you want:
- English TeX (PLAIN)
- German TeX (PLAING)
- English LaTeX (LATEX)
- German LaTeX (LATEXG)
and you'll need, perhaps, to set up the FORMAT DEFAULT to an

appropriate choice from that list.

The "big thing" now would be to actually select a file for processing. This is done using the option "FIND MAIN FILE", from where you seek out some .TEX file for processing, and then have the shell "TeX" it.

After that, there's a bunch of extra possible features (additional conveniences, as it were), and the option of running BibTeX, MakeIndex, and other such stuff. By the time you get around to figuring out those systems, you'll probably be able to guess what they do fairly well.

What English documentation there is with CS-TeX is fairly good; check it too.

Amen to that. I've got a TT too, and while I am happy with it, I would like to upgrade from the TOS 3.01/720Kb floppy I have now to 3.06/1.44Mb. I mean I'd REALLY like to do it...really...I would...but I can't. Don't think I haven't tried -- in fact I've been trying for, oh, at least 6 months now. My local dealer has tried 2 different suppliers, one Canadian and one American, but with no luck. The story he got was that Atari is waiting until they get X number of orders before they start filling them. Well, thank you for nothin'.

Anyway, I finally got fed up with the whole thing and bought a floptical (much to the delight of my local dealer, I'm sure, as it cost about CAN$400 more that the upgrade). Now I'm happy. I can finally read those pesky HD disks. I even backed up my ENTIRE hard drive. Imagine!

Well, I think I've rambled on long enough.

Any good Atari dealer would be happy to sell you one. They sell for around $400. Try ATY Computers in Oakland, CA (510-482-3775). Tell Alex I told you to call him about TT RAM boards. Specify that you want the 32meg board (GESoft).

>
> If Alan wants to go ahead and re-kindle the CFD I am happy to place
> all the magazines in here for the world.
>
> However you will have to support the CFD and get the "100" votes etc.

After mulling the results of my straw poll over the Christmas break, I
came to the conclusion that either

1: Atari owners are an apathetic bunch who won't get behind any efforts
to improve their lot.

or

2: There aren't any atari users on the net.

FTR I received 16 (yes, only 16!) pieces of mail regarding the question
of creating this group. Most were positive, but the few that weren't
were vocal in their opposition to the creation of the groups.

I cannot run a full-blown vote on the issue, as I am currently
unemployed, and now that I'm being charged for email traffic, a hefty
bill is likely force me off the net. If somone is interested in acting
as votetaker for the 2-3 month period required for an official RFD/CFV
then please email me.

Meanwhile, I feel that perhaps Jon should post the magazine to
comp.sys.atari.st for a month so that the general readership can judge
for themselves whether bringing znet into the c.s.atari heirarchy is
worthwhile.
Those that don't like this idea are free to disagree with me, but it
won't add significantly to the traffic here, and you are free to use a
killfile or "n" key to skip it if you don't want it. There's more
traffic generated in amiga-atari weenie wars than a month's worth of
znet postings.

Constructive comments to c.s.a.st, flames to dev/null... :)

3614. ANNOUNCE: Fortune V1.0 for Falcon 030

Newsgroup: comp.sys.atari.st
Date: 1993-03-03 11:12:58 UTC
From: mppi76@cd4680fs.rrze.uni-erlangen.de
Message-ID: <1n23rqE2d7@uni-erlangen.de>
Source record: 209408

```
Fortune V1.0

The final version 1.0 of the Fortune program is now available at
archive.umich.edu in the atari/falcon directory.

Fortune is a program that tells you a fortune whenever you boot your
Falcon. Like on big Unix machines statements of well know persons
will be shown on the screen. But you will also actually hear them!

You will hear Captain James T. Kirk, the Terminator, Monty Python and
a lot of other stars in the unique sound quality of the falcon.

You can produce your own fortunes using the harddisk recording program
WinRec to record the sample and then editing the sample with Fortune.

Another very interesting feature of Fortune is its capability to import,
export and convert many different sound formats. You can use:

- DVSM (used by WinRec)
- AVR (used by many ST/TT/Falcon programs)
- AU,SND (used on SUN, NeXT)
- WAV (used on PC's)
- Raw (for many other cases)

Fortune comes together with 40 sound cites and is available in a German
and English version.

--
Harald Schoenfeld | I'm sorry Dave,
(mppi76@cd4680fs.rrze.uni-erlangen.dbp.de) | I'm afraid I can't do that.

3615. WinRec 1.0 with DSP-effect for the Falcon posted

Newsgroup: comp.sys.atari.st
Date: 1993-03-03 11:24:49 UTC
From: mppi76@cd4680fs.rrze.uni-erlangen.de
Message-ID: <1n24i1E2s7@uni-erlangen.de>
Source record: 209411

```
WinRec V1.0

The version 1.0 of the WinRec harddisk recording program for the Falcon030
is now available at archive.umich.edu in the atari/falcon directory.

WinRec is not only the first PD harddisk recording program for the Falcon,
it is also the first program to use the DSP for online sound effects during
recording or playing.

2 DSP-LOD files are included in the archive.

WinRec is also good for the use with Fortune V1.0, which is available
at the same place.

So we're not allowed to be excited about the prospect? It's at last a demonstration that Atari are taking their graphics hardware seriously. The ST was fairly crippled in the graphics area by static sized screens and such, so at least now we've just about caught up.

3621. 50hzboot.prg -- how to use it

From: wooledge@ces.cwru.edu
Message-ID: <1n2hmeINNbuq@usenet.INS.CWRU.Edu>
Source record: 209413

Hello all. This is my first post to this group, though I've been reading it on and off for some time now.

I have downloaded a few programs from atari.archive which will run on my machine but which have a fast-scrolling screen. I read the FAQ and got 50hzboot.prg from atari.archive to try to solve the problem. But it only seems to make things worse.

Hardware configuration: Atari 1040STf, 1 Meg, SC1224 color monitor, hard drive, internal DS floppy.

Example 1: I got the new Centipede program. The first screen (Sinister) looks normal. After that it goes to flicker-scroll mode and asks for your language, etc. (Barely readable, quite irritating.) After that, there is some sort of shareware announcement which I can't really read, then the game itself, all in flicker-scroll mode. When I run 50hzboot.prg, then insert my normal boot disk, the desktop appears in flicker-scroll. I can manage to run centi.prg, but then even the initial screen is messed up. The rest doesn't seem to change.

Example 2: I have another game called Escapade. Similar story -- initial screen looks fine, but the game itself is flicker-scrolling. 50hzboot messes up the initial screen, but doesn't fix the game screen.

Has anyone gotten either of these games to run on an American monitor? Am I being entirely stupid, or only partially? Any help appreciated.

>
>Don't we already call him that? :)

How true, Dave B. But the real question, I think, is will such a product be a viable one? I've got no doubt that "Miracle Man" Small could indeed wrangle his way to a Mac emulator with 256 or 512K ROMs, support for System 7, and color too. At least the Falcon030 provides a feasible hardware base. Even so, I question whether it would be economically feasible in light of today's falling Mac prices. How much would folks be willing to pay for such an emulator, on top of their Falcon investment, when that little Mac Color Classic 16MHz 030 is going to retail for $1389 in a 4/80 configuration?

But gee, wouldn't it be cool? :)

On GEnie last night, Bill Rehbock of Atari reports that the "window" has
always been the 3rd or 4th week of March. Whatever. He says the vice
president in charge of production (no names mentioned) says everything
is looking good in the Taiwan plant to meet delivery schedules. He also
said that Atari "really, Really, REALLY wants to meet this one" (by that
referring to the deadline, supposedly ANYTIME in March).

On a brighter note, AtariWorks is shaping up to be a very nice package.

"We shall see, said the blind man."

I had a similar problem with Centipede. To solve it, I just adjusted my vertical hold on the monitor so the screen would stop scrolling. The adjustment made no difference to other programs that didn't have this problem (it just never came up except on a couple of programs).

3629. Re: Diablo emulator question

From Page 42 of the SLM804 Diablo Emulator manual, Engage Font 2 command is ESC O, or decimal 27,79 or hex 1B,4F. This switches to the second font installed by using SETUP630.PRG. 3rd font is ESC W or 27,87, or 1B,57. Go back to main font is ESC W or 27,87 or 1B,26. Generically setting the Main font, font 1 installed by the setup program is ESC SO d or 27,14,d or 1b,0e,d. d=the font no. you want to set to main font.

Actually, the reason why this is vouchsafed for American Pronounciation is that most Standard American English vowel sounds were placed just before and during the last great British vowel shift of the late 17th century.

Cork English is also said to be accurate; witness they (and Shakespeare) ryhming barley with fairly, harm with cairn, etc.

Is there a newsgroup for this sort of thing?...

: >
: >

: And how much will they cost? "Power without the price," folks.

That "power without the price stuff went out of Atari's marketing
strategy with the ST." With other manufacturers cutting margins,
Atari cannot compete based only on price any longer. If they expect
to remain in the market, they'll have to become competetive with
FEATURES and THEN cut the price below clones and Apple products
to pursuade (sp?) new users to take a chance with a small company
selling a relatively unsupported platform.

I would hazard a guess that the new Mac prices will be competetive.
Apple is already discounting their current models even more in
anticipation. I saw the Mac Classic II with 4 megs RAM and 80 meg
hard disk and keyboard for $899 the other day at the store.
Hell, I remember when a 68030 Mac cost more than a new car, but
thankfully those days are gone.

Cheers,

Chris

Back in October a new program called MacSee was being sold at the WAACE show. It is from a small company, whose name I currently forget. At $50, it was a great deal. Best guess is to call TOAD computers at 1-800-448-toad and ask them. They also had copies on sale at the show.

3640. NCSA Telnet under Spectre GCR?

Newsgroup: comp.sys.atari.st
Date: 1993-03-03 23:57:23 UTC
From: david@bdt.com
Message-ID: <1993Mar3.235723.25109@bdt.com>
Source record: 209428
Cross-posted to: comp.sys.atari.st,comp.sys.mac.comm

Has anyone managed to get the NCSA Telnet 2.5 package working
using SLIP under the Spectre GCR Mac emulator for the Atari ST?

I set "hardware=Serial" in config.tel and all I can get it to
do is give me the "could not connect to hardware drivers"
message at startup. I fear that the built-in NCSA serial
drivers aren't compatible with the emulator, but I thought I'd
check to see if anyone has got it working.

For several years I've been using a cartridge-based clock device I got from
Navarone (are they still in business?). It's kind of bulky, but it works, and
it's nice not to have to open up the whole machine when the battery dies.

I know there were several devices -- a collection of desktop utilities, even a
kind of an external hardware ramdisk -- available at one time. No idea if
they're available now.

>(I assume the sources are 3rd party developers).

The problem is that can Atari outshoot Matsushita Electronics? 3DO licensed
their game formats/etc/spec to other manufacturers so the heavyweights
can battle for a piece of the console market for 3DO, so that means that 3do
units will be dirt cheap due to competition. Alas even if the Jag is a better
technical product, it will die an unsupported death. I really hope Atari
takes a strong foothold in the Home Console market.

3643. Wagers on f030 sales? Tick, tick, tick...

Newsgroup: comp.sys.atari.st
Date: 1993-03-04 02:28:43 UTC
From: smiller@bcarh838.bnr.ca
Message-ID: <1993Mar4.022843.14226@zoonews.bnr.ca>
Source record: 209444

I'm afraid I'd have to bet that Atari computers will vanish this summer. The Lynx and Jaguar may be able to carry the company, but I don't think the Falcon will do the trick for the computer side of things.

The reasons?

1) It's been WAAAAY too long since the F030, and it's prices, were announced. The Amiga 1200 and the new, cheap Macs have stolen Atari's thunder. Sure, the Falcon has a DSP, but that's all.

2) Atari will give up (in computers) before they go belly-up. I don't think the Tramiels are in it to build neat computers. (which they inadvertantly do) They are in it to make money. If they don't see themselves making money with computers, that'll be the end of the computers. (a la NeXT) From a business point of view, there will be no point in pumping effort and money into a market that isn't going to pay. Sometimes, a company might do that to preserve it's credibility. Atari doesn't have that to worry about.

As for this business of 'We didn't support the ST because we didn't think it could compete against the PC clones, but the Falcon can.'; that's either being dishonest or stupid. Look at the joyous reaction to a writeup in BYTE for the Falcon. Remember when the ST was on the cover? 1st 1 meg machine under a grand? It wasn't followed up, and it withered away...

I don't know. While the Falcon looks to be really cool, it also looks like it was deliberately crippled in order to make it easier to come up with an 'improved' machine. It's a little too entry-level to be believed. Squeezing all that into the 1040 case means 1) you can't use standard memory 2) you can't use 3.5" hard drives (which are available in a much larger range than the newer 2.5", and are usually cheaper) Why save a couple of bucks on a case when you have to turn around and spend that and more on memory and HD?

Well, (putting my optimist hat back on), the only think I can figure is that the F030 as we have seen it is either 1) going to be (re?)introduced at a much lower price and/or 2) going to be accompanied by the Mega Falcon at it's release later this month. (Maybe even the 040) Maybe it was a ruse to get Commodore to release the A1200 before they should have. (And to make a shopping decision easier for those indecisive would-be computer buyers)

If it's true that lots of developers have their Falcons, and are diligently working on some cool software, things will be good for the few of us who will buy one. And yes, I would still like to buy one. I expect that I will wait a bit though, either for the neato software to come out, or for the company to throw in the towel, and I can pick one up cheap. It would make a nice, comprehensive upgrade to my 520.

If I don't buy a Falcon, I'll probably put off buying a computer this year. PC's have raw power, but they're a genuine pain in the ass. (You don't use one, you configure it). I was playing SimCity on an Amiga last weekend. It was great, up until the time it gave me a 'Guru Meditation' when I tried to save my hours of work. That reminded me of my previous experiences with Amigas. (grrr...) Macs are just kind of... boring, I guess. They don't excite me. Maybe the first generation of PowerPC...

We shouldn't have to wait long now, though, to see either way.

(Oh yeah, I saw the new Maxtor 2.5" drives in Computer Shopper; the 25252 is 252 megs, and I saw it for $409. This is comparable to the $/meg for 3.5" drives. Direct-to-disk recording can use LOTS of megabytes)

If you are running a US monitor in the US, there should be no problems.

If you are running a UK monitor in the US, or vice-versa, there probably will be problems.

if switching into 50hz causes your screen to 'flicker-scroll' then chances of making things work are not too good!

It will work however. Try getting DC-bootit, and using that to switch into 50/60hz. it might make a difference (unlikely).

As you mentioned yourself some people use it for a real-time clock.
However, probably the most important use for it is Spectre GCR. Spectre
contains the Mac ROMs for Mac emulation.

I'm sorry to say this Doctor, but David's closer to the truth... There
was a UK-made (??) series shown on TV over here called "The Story of
English" which revealed that the British English - actually the "Oxbridge"
accent is not a "natural" one, having been cultivated only recently.
(Actually, David's probably seen the same TV series.)

There is strong evidence to suggest that in Shakespeare's time, the
English that was spoken is close to what sounds like American now.
Actually, what is spoken in Northern parts of England used to be more
widespread and in common use.

I can chase up some more info on the matter if you like...

I think there is QFax that is shareware. The problem is that I
don't think it is on an ftp site.

I think I know what BBS it is on, but it is a long distance call
and I have the worst luck when it comes to downloading large
files while on long-distance toll charges. Otherwise, I would
have put it up on atari.archive already.

Yes, clocks are common. There are also sound samplers, Macintosh
emulators, 68000 monitors, and other nifty doodads you can plug in
there. I've got an ancient Magic Sac mac emulator in mine, being used
as a clock card :-)

The cartridge port is just a 128K ROM port. With special tricks you
can bank-select more than that, or even write data to the port (using
the address lines and latching tricks).

Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.st.tech

```
------------------------------------------------------------------------
NOTE: THIS IS A NEW CALL FOR VOTES, REPLACING THE OLD ONE WHICH WAS
*NOT* VALID!!!
IF YOU HAVE VOTED FOR THE OLD ONE, YOU MUST VOTE AGAIN, SINCE ALL
PREVIOUS VOTES HAVE BEEN CANCELLED!!!!!!!

SORRY FOR THIS INCONVENIENCE...
David Oakley, Proposer
------------------------------------------------------------------------

FIRST CALL FOR VOTES
====================

This is a Call for votes on the creation of a newsgroup for
debates about the Atari range of personal computers.

Group Name
==========
comp.sys.atari.advocacy

Status
======
Unmoderated

Charter
=======
This group is a forum for discussion of topics in connection with the Atari
range of computers - marketing, capabilities, comparisons and other
arguments... It will move discussions of this nature from the existing
comp.sys.atari.st (and atari.8-bit) newsgroups, which will exist for a more
advice orientated discussions.

Users will be requested to not post the above discussions in the existing
newsgroups if advocacy is formed.

Rationale
=========
This group will separate a section of discussion, mainly from the current
newsgroup comp.sys.atari.st but also relatted topics including the Atari 8-bit
range of computers (atari.8bit) and the new Atari Falcon computers.

The discussion of advocacy currently takes up over 50% of the items
in the atari.st newsgroup and so it is felt that the original
purpose of the newsgroup is being left behind.
```

New users and people who need information about the Atari ST/8-bit computers
can continue to use the original group and would hopefully get more
attention if there is less advocacy mail present.

Voting
======
VOTING PERIOD IS:
appearance of this message
to 1st April at 9:00 GMT.

HOW TO VOTE:
1. REPLY to THIS message.

2. send your votes to:

dxo@cs.bham.ac.uk

3. if that doesn't work, try:

dxo%cs.bham.ac.uk@nsf.ac.uk

WHAT YOUR MAIL MESSAGE SHOULD CONTAIN:

For a yes vote:

I vote "Yes" for the creation of "comp.sys.atari.advcoacy"
VOTE: lastname, firstname [email address] : YES

For a no vote:

I vote "No" for the creation of "comp.sys.atari.advcoacy"
VOTE: lastname, firstname [email address] : NO

Your message must be of THIS form, especially the second line since
my vote counting software needs bothe the 'VOTE:' and the ': YES/NO'.

Rules on voting
===============

Voting Rules:
-Only one vote per user (Two different people cannot vote under the
same user name).
-Any votes which are received before or after the voting period
will be discarded.
-Any vote which does follow the above examples specifically,
will not be valid.
-Anyone who wants to change their previous vote may do so by voting
again. They must indicate that they have previously voted and are
changing their mind in a footnote. A changed vote will discard your
previous vote.

Ambiguous Votes:
Ambiguous votes -- those who do not follow the specified format, or
do not make clear the voter's intent, will, where possible, be

returned to their senders for clarification. Ambiguous votes which
cannot be returned to their senders or for which no clarification is
provided will be identified in vote mass acknowledgements and in the
final vote tally.

******* ANY PROBLEMS, MAIL THE ADDRESSES ABOVE! *********

Thanks to Danny Richman for the basis of this CFV!!!!!

As said in a previous posting, I just got a modem...(welcome to the 20th century...) anyway I've been deluged by all the offers for "free" time on Compuserve, Genie, Delphi, America OnLine, ad infinitum...can anybody who has access to these services tell me which they think would be the best for me...having a 1040ST? Are there other programs on the services that I can't get from ftp sites and A.A.U.E.? I would just like to hear of peoples experiences, what they cost, and how much you use them, and such. I will probably subscribe to at least one of them to keep my email and such going in the summer when I don't have my account at school.

Actually, yes. I have a scanner attached to it. I would rather
have had it in some other port however, I am constantly aware that
some day that the loosely connected cartridge is going to break.
There are other devices for the cartridge port as well, Spectre GCR
is one of the famoust.

...those nice Ghostscript-interpreter program for the Atari really
makes _terrible_ use of the hard-drive? I am running a TT with 4MB ST
ram with nothing but MiNT and TCSH running, yet when I try and print the
test page, I get a "not enough memory" for any resolution above 100dpi
(using the -r command). What is wrong with building the image and saving
the image to disk, and then DMAing from HD? I know about the banding...
I'll be trying that as soon as I figure out how, but still...

Also, does anyone know why bolded text in 1stword printed out
(using the Diablo emulator) messes up the character spacing on a SLM?
I remember something about high print-density characters (bold, strike-out)
characters might do this, but _why_ should they?

While I'm at it, has anyone had a problem with little speckled
dots showing up in the output of the laserprinter? I cleaned it out as
good as I could, but doesn't seem to help. Bryan had suggested that it
might be a noise problem on the ACSI port (noise?) but a) it is the only
device on my TT's ACSI port, and b) I am using the Atari supplied cables -
if they were too long I am sure someone would have spotted this problem
long before now....

Thanks for listening, but I'd REALLY appreciate answers. ;)

Well, I have a _very_ nice 400 dpi Migraph Hand scanner that uses the cartridge port on my TT.

And while I am here I would like to tell you of the new program that was announced here, Speed of Light GIF viewer. This is the _absolutely_ most amazing graphics viewer I have ever seen. Everyone should get a copy. Through the internet I have had the opportunity to get quite a few nice GIFs and I view them on my DECstation RISC machine at school. Well, the Speed of Light program enables me to view those GIFs exactly as they look at school! It is amazing!!! More people should write stuff like this! I am going to be sending him my $15 dollars!!!

You can get the program from atari.archive.umich,edu atari/Graphics spoflite.lzh

Where's the Atari with a DSP? I'm willing to bet that Apple
will be shipping a "DSPed" computer in quantity before Atari.
Atari has been TALKING about the falcon for quite some time,
but I see messages on this group all the time from people who
cannot seem to find one.

Apple is shipping 68040 boxes in quantity now! Atari doesn't
have the R&D budget or the manufacturing capacity to keep up.
Damn shame.

Cheers,

Chris

I give up. All I can find are patches for MINIX on the ST. I may be incredibly stupid, but I thought you needed the source code in its own completeness (?) to patch up.

Could someone (barrage of mail) please help me. All I want is:

. MINIX
. Running on a 1Meg ST
. With 5-10Megs free HD space

Oh, and BTW, do any of you know if MINIX is loadable from a HD partition (ie can I `mkfs /dev/f' or something and boot from there, perhaps with the root fs still on ram disk and /dev/f mounted ??)

Dave.

Hallo fellow Atari-type-creatures!

I have now got my 1040Ste setup quite nice as an amobea equal (if not better)
I have 8 Channel Tracker Music.
I have 19200/32768 colours displayed on screen from 24-bit Pictures.
What I don't have and find the most frustrating, is a full screen animator.
The amobeans are blessed with the stunning work of Eric Schwartz and Tobias
Richter, two of the best animators ever to grace the world of animation.
Now, I know that we can obtain Tobias Richter Works now from certain places.
(Anyone know of any sites that have any of his stuff?)
But as yet, nowt has been heard of Eric for ST. Well, me and my amobea friend (?)
have decided to try to combat this.
It is - in theory - easy, the frames he creates are 16 colour 320/256 IFF
images. All we need is to chain them together on ST.
Problem: I have no program for the creation/storage/linking of full screen
16 colour frames! I have searched far and wide, but to no avail.
It's simple!!! All I need is a program to load IFF's (I would even convert
each individual frame into a NEO/PI1 format if need be!) then chain them
together as an anim file! Then simply use a runner! That's all!!!
I have seen the results of programs like these. CyberSEQuences, I've got one
called catnap which is good. All that is is full screen cell anims!
Does Cyberpaint/studio do this?

Does anyone know of a program that will do this for me?

If you've ever seen Eric Schwartz anims on an Amiga, then you'll understand
why I want them accross!! (Amy Vs. Walker, At the Beach, At the movies,etc)

It's not just for that ofcourse. My amiga friend wants to do some anims of his
own, and would like his art to be seen on both machines, along with my MODS.

So here's an alternative. As an alternative to a program to do the job of
linking the frames, does anyone know of a way in which I could chain them
together using GFA Basic or STOS? I get the feeling that that would be
more flexible!

I'm sorry for this lenghty query, but I'm desperate to see these animations
on my own machine!!!!

Thanks in advance....

Feekzoid

| ...those nice Ghostscript-interpreter program for the Atari really
|makes _terrible_ use of the hard-drive? I am running a TT with 4MB ST
|ram with nothing but MiNT and TCSH running, yet when I try and print the
|test page, I get a "not enough memory" for any resolution above 100dpi
|(using the -r command). What is wrong with building the image and saving
|the image to disk, and then DMAing from HD? I know about the banding...
|I'll be trying that as soon as I figure out how, but still...
|
| Also, does anyone know why bolded text in 1stword printed out
|(using the Diablo emulator) messes up the character spacing on a SLM?
|I remember something about high print-density characters (bold, strike-out)
|characters might do this, but _why_ should they?
|
| While I'm at it, has anyone had a problem with little speckled
|dots showing up in the output of the laserprinter? I cleaned it out as
|good as I could, but doesn't seem to help. Bryan had suggested that it
|might be a noise problem on the ACSI port (noise?) but a) it is the only
|device on my TT's ACSI port, and b) I am using the Atari supplied cables -
|if they were too long I am sure someone would have spotted this problem
|long before now....
|
| Thanks for listening, but I'd REALLY appreciate answers. ;)
|
|-MikeB

This sounds like the bug I once found in the SLM804 driver (at the
time 2.3 was around I think). I don't know if the bug still exists
in the newer versions, I ported my own Ghostscript an fiddled with
the driver (I don't need the diablo emulator anymore).
The bug caused a malloc of the memory chunk for the SLM804 bitmap
to fail, because the memory size was expressed in a short instead
of a long. The short overflows, the malloc fails. Maybe you have
to experiment with the banded printing option until you find a value
for which it does work.

> such offer from ICD or is that just wishful thinking.

I was under the impression that Cleanup, since it was a separate product from
ICD's host adaptor line, did not require an ICD board to work. However, I
would think that they do have an upgrade policy. Give them a call at
(815)968-2228.

IMHO, however, you should put your money into a copy of Diamond Edge. It is
excellent stuff! In addition to all the diagnostic and repair functions, it
is also a defragger (with Norton style display), and allows one to save the
important system sectors on a floppy (boot block, FATs, etc.). I like it
much better than Cleanup.

aesd1pak@dct.ac.uk writes:

>I hear from one off the st mags (ATARI ST USER) that atari have finished
>producing STE's.
I was a bit surprised when I read Atari ST User. But I think they are
incorrect. Atari was stopping the production of Mega STE, because these
have become obsolete by the advent of the falcon 030.
>I find that atari have shown a lack of support for the computer.
> They are now only doing the falcon and it seems the TT has been axed as
>well.To increase this point atari said last year that they were producing
>software for the STE only but were is it.
The TT has not been axed. Until a faster Falcon is available the TT
will remain the HIgh end machine.
> SHOULD we let atari continue with thier attitude to drop there support for
>these great machines or should we do nothing and see how the FALCON will do.
The STE are still supported by Atari as are the Mega STE's. The only
thing that has changed is that Mega STE are no longer produced since
they do not provide enough advantages over a ST to warrant the price
when compared to a Falcon.

3669. More trouble installing Neodesk 3.03

Newsgroup: comp.sys.atari.st
Date: 1993-03-04 16:02:29 UTC
From: ultron@csd4.csd.uwm.edu
Message-ID: <1n596IINN2j9@uwm.edu>
Source record: 209307

I too am having problems with the new Neodesk, but not like anyone elses. The updating and installing seemed to work fine. However, when I try to access Neodesk from my hard disk (where I had it installed) I get 2 bombs and the error: BUS ERROR. After the error, I press R (for the register dump) and return to the GEM desktop. If I then try to run Neodesk from the Master disk in drive A, it works! I've recopied the files a few times onto the C drive, but it continues to fail to boot from the hard disk.

Anyone have a clue as to why it won't run from C?

I am interested in buying a used Atari 1040STe and would be willing to pay from $250-300 depending on how old it is and what kind of shape it is in.

I do not need a monitor with it but will buy one if need be.

I live in Kitchener-Waterloo and would be willing to travel up to 2 hours away to see the system. Otherwise there is always UPS I suppose.

If interested in selling or you know of someone who is, please leave me E-mail. Thanks.

A commercial grade program called MacSee is "supposed" to do just that but
I have only been able to get it to work a few times - maybe I'm doing
something wrong, but it seems to complain when copying large files to the
Spectre partition. It does let you see the directory structure though.

In a previous article, haasnr@ucunix.san.uc.edu (Nicholas Robert Haas) says:

>I recently got the PhotoChrome Image Viewer from Umich.. Seems to be neat
>but I am having a little problem with it.. I saw it mentioned on here that
>people were using it to view GIFs.. Well WHen I load it up, the only option
>that is NOT available to me is 'View GIF images'.. Its greyed out.,.. Any
>idea why this would be?? I have an original 520st upgraded to 2.5 megz..
You will need at least version 3 of photochrome to convert GIF's directly
(V3 also lets you conver some other formats like IFF, TARGA) Nevertheless
you might also want to get GIF2RAW, a program that reduces a GIF by half
and saves it in RAW format. The reason for this is that the scaling
algorithm in Photochrome (Squish GIF) will always try to squish the whole
image onto the screen resulting in some terribly distorted images if the
original GIF was something like 320x700.

(The 320x200 GIF's look MUCH better on any ST with photochrome that a 320x200
x256 display on a PC!!!)

I thought you guys might get a laugh out of this (kinda sad, actually).
This is an excerpt from an editorial by Tom R. Halfhill (sounds like
a Hobbit-name, huh?), which appeared in the April, 1986 issue of
"Compute!":

"... Atari recently introduced the first 1024K computer for under
$1,000, just five years after an 8K Atari 800 retailed for $1,000.
And Motorola recently announced a 20 megahertz version of its
68020 microprocessor, referred to as the 'mainframe on a chip'. "

Geez, and they are only NOW breaking past that 68020, and still
NOT in commercial quantities! Oh, wel....
l <--- the 'l' that fell off of the "well', above!

I've got a Migraph PS400 page scanner plugged in to mine. There are/were
other scanner interfaces for both hand and full page scanners that used
the cartridge port. When I asked Migraph why they chose the cartridge port
for the scanner interface, their reply was that it was the one port that
Atari never fiddled with on any different ST/TT models. I don't know if
that true, but it was the reason given.

Ignorant comment.

My comment (and the one I was replying to) was about why the Falcon would be good for MIDI and sampling. The Falcon can do direct to disk 8 channel 16 bit 50KHz sampling, with no additional hardware. The Falcon comes with a large HD, internally. So what is wrong with me asking for a PC to have one. Also I said 486 DX2, because any sampling package on a PC is going to be Windows based, and that'll require a lot of processing power. Its plain and simple, the PC isn't designed for this task, so it needs an add on board to grab the data, and then a good subsystem (486 DX2, and snappy hard drive (IDE)). My comparison is valid for the application being discussed. If you think I'm being unfair, then say so, and give a reason why, but I'd say that a DECstation 5000, a SPARCstation, an SGI, a Mac and an Amiga, will all need add in cards to do the sampling, and a local disk to save it on (for the workstations, I doubt (could be wrong) you could do direct to disk over a network).

The fact is for the application being discussed, the Falcon requires no extra hardware. For any other platform it does, and the other platform won't be set up in such a way as to take good advantage, so it'll need to be more powerful just to match up.

Another point, if you don't want a 486DX2, then use a 386 (if you think thats a fair comparison.. I don't), it *STILL COSTS MORE by a long way* than a Falcon, which was the other point being discussed - quite apart from the 386 boxe's performance won't be as good at DTD recording.

My reply took so long, since I think I get crossposted news. I saw your comment as part of someone else's post.

>bytes right through my Midiws calls. I get all kinds of exclusive checksum
>errors and buffer overflows on the 32. As all sequencing software I know,
>beneath the nice surface there is utter crap, in Cubase as well.

I wrote an Accessory, that uses Midiws calls as well, and get the same problems while using it in parallel to Cubase (2.0). I solved that problem simply by splitting the MIDI-Strings in smaller SysExcl-chunks and making some evnt_timer(0,0) (Yes, thats enough!!) calls between them to force a Process Switch (AES-Call!), so Cubase sends its own data without damaging a SysExcl Data of another Process (By the way: My program is a Databank and Voiceeditor for YAMAHA PSS680 Keyb (5 Banks), if someone is interested..).
I've found the reason for the Window problems, too: If you make a Mouse-Click on an Accessory-Entry in den Menuline, you often hold the Mouse-Button too long, so Cubase-Window-Management thinks, it has to top the window under the mouse! This problem also appears while using popups, that are out of the borders of your accessory-window, but you can do nothing against it, exept making very short mouse-clicks ;-).
As I want my program to be controlled the same way as Cubase (right-, left- and double-click on values), I ran into another problem: evnt_multi() does not report doubleclicks, if it is called in parallel to Cubase!!
After some time I noticed, that it is possible to doubleclick, but must be done very fast!!! Perhaps Cubase calls evnt_dclick(4) to stop double-click reporting, and uses its own doubleclick timer?!

Similar experiences with Cubase? Let me know!!

Ciao, Kol

Spice is a simulation program. Text mode, to simulate analog electrical circuits.

r1 1 2 200 (is a 200 ohm resistor from 1 to 2)

(example of input...)

The output consists of DC bias voltage/current, and optionally a listing or ASCII plot of the voltages / currents present vs time or frequency.

Again, how you set up the tests makes a big difference. If, on the one hand one prepares a set of 64 grey-scale flash cards, and ask people to do A-B comparisons (A lighter than B, A darker than B, etc.) then I believe the 32-64 number quoted is likely to be correct. However, if on the other hand, one renders a ray-traced sphere with 64 shades of grey, and ask people if the bands between adjacentshades are discernable, I know what the answer is. The huma eye is extremely efficient at detecting the boundary between adjacent blocks of varying luminance levels and 64 shades is far from sufficient. As I posted previously, this is called the "Mach effect" (can't swear to the spelling) and I have examined such ray-tracings and color bar charts and there is a WORLD of difference between 256 shades of green and 64 shades of green. Since the original question was how bits per pixel are required
for "true color" rendition, the answer is 24, possibly 21 if green gets 8, red gets 7, and blue gets 6. Keep in mind this assumes a linear luminance scale and RGB color space. One could probably get by with less bits if YUV or HSV is adopted, since luminance levels are the key here. SO put away your medical texts and get out your paint programs! keep in mind it
is dangerous to draw conclusions from such medical information, unless one knows how the tests were conducted.

3692. Beyond Spectre 3.0

The only way I can run GCR on my TT right now is to have Mac partitions on an external SyQuest 88 drive. However, here's the twist.

If I connect the SyQuest to the TT via the DMA, I crash my TT every time if try to move files between the TT's internal HD and the SyQuest. If I connect the SyQuest via the TT's SCSI port - no problems at all.

But, but, but... I cannot run Spectre GCR, version 3.0, of the SyQuest when it is connected to the TT via the SCSI port because version 3.0 of does not support drives on the TT's SCSI chain. I can only run GCR when the SyQuest is on the DMA (do not get any crashes like in in Atari mode; that's probably because I am not transferring files between devices).

So!, I can only use GCR when the SyQuest is on the DMA and I can only use my Syquest reliably in Atari mode when it's on the SCSI.

Therefore, puff, puff, when will Gadgets ever release a version of GCR that supports the Atari SCSI chain (I have waited patiently for over two years when Gadgets stated it would be weeks before 3.1 would be released back in 1991).

Did you replace all copies of the neoload program (in your auto folder, for
example)? Or the Neodesk accessories? These could exist outside of your
regular Neodesk folder on your hard disk.

I'm afraid that the reason you cannot find the sources for Minix is simple; Minix is a commercial package that is sold by Prentice Hall. It can be obtained free if you are an educational establishment.

Patches are numerous particularly at the moment since there are patches to go from the current Prentice Hall release version 1.5.10 upto the latest 1.6.24 or .25 I can't remember!

> Oh, and BTW, do any of you know if MINIX is loadable from a HD

Yes - Minix is loadable from hard disk although I load the kernel from floppy which then loads all of the other components from the hard disk. I am not sure if you can have a hard disk booting Minix, or if you would want to risk it!

Booting from floppy is trivial really since it is really only a case of stuffing a floppy in the drive, rebooting and waiting for about 30 secs for it to boot.

>

Well I personally guess number ONE. i agree the amiga-atari flame war
has equated to 79% of this newsgroups traffic.

Which goes to show that when threatened the Atari user comes to the
fore but not until then.

I would point out that the Z*NET magazines being a labour (labor for
our USA readers) love has promoted these devices for many years
and stuck with the Atari platform and when it comes to a straw poll

only 16 YES votes is _very_ disapointing to say the leaste.

This is why the alt group was set up in the first place!

So chaps as Alan can not do the CFD I am happy ONCE AGAIN to get the ball rolling on my site here (a private -Jon_pays_all_the_bills _site_not_the_firm_I_work_for_site_) but I must stress we need a 100 plus votes for the newsgroup!!!!

So if you sit there saying ok so what, forget alt.znet moving into the comp groups. Those of you in North America have GEnie and CI$ to download it from but the rest of the world _does_not_ have the access you enjoy.

Remember with over 220k sites on Usenet (and sub-nets) there are more sites OUT of north america who do not enjoy access into the alt.groups that we enjoy (also remember where New Zealand is chaps 30hours flying time from New Jersey the home of Z*NET, I know I done the flight enough times) and we are driving a GLOBAL Atari interest group from here down under.

I guess Alan (who is 300 miles south of here) and i hoped some large site in the US or Ca domains who do not have to worry about the email charges (70 cents per k including headers) would run with the CFD this time.

Consider this chaps ...

I ring tolls ($5 per minute) to dload Z*NET each week from here in Aucland to the USA and place it in the alt.znet groups but I have no problem with this as it is my little bit for the Atari User community world-wide.

Now it is YOUR turn to see that the world gets the atari news by voting for the CFD soon to be posted in news.groups and c.s.a.st and we need at leaste 100 clear votes to create it.

I will set up the voting YES and NO addresses tonight on this system in NZL.

To vote yes email yes@STaTus.gen.nz to vot no email no@STaTus.gen.nz

Read the cfd when it is posted at the end of this weekend and VOTE chaps, vote.

Regards to all from the Z*NET Pacific Crew

I would like to find, if available, a program (or software) that has a word processor, database, and spreadsheet, and perhaps a paint program, all integrated together that can be used with the Hewlett Packard DeskJet 500C printer (a driver for it). Anything between this and something close to this will be acceptable. But the only thing I have is HPChrome (unregistered), and my HP won't print the colors on the screen! It prints red, yellow, pink, (and black, but only if I change ink cartridges) but doesn't print the colors shown no in the right places on paper.

If I don't find a program to make better use of this seemingly IBM-only printer, I'm going to sell it and probably go to either a laser printer or a cheap dot-matrix again... H E L P !!!

Please reply in Email to: jared@midiline.la.ca.us

|>

Partial list:

- yes, real-time clocks; one model was a pass-thru, allowing
other cartridges to be used as well

- as someone mentioned, the StereoTek glasses; mine still work

- the Migraph hand scanner

- network adapter, for networking multiple ST's

3710. GUIs a study... my final year project

Newsgroup: comp.sys.atari.st
Date: 1993-03-06 01:07:34 UTC
From: sgj-a@minster.york.ac.uk
Message-ID: <731380054.15124@minster.york.ac.uk>
Source record: 209330
Cross-posted to: comp.sys.mac,comp.windows.x,comp.human-factors,comp.windows.ms,comp.windows.x.motif,comp.windows.open-look,comp.sys.atari.st,comp.sys.acorn

I am at the moment completing my 3rd year project on GUI's and have noticed that very few people have ever asked a large group of users what they think of the Interfaces they use and what are the +'s and -'s. As a result I am attemptin to do this. If you could just take a few mins to reply to this and say what interface you are using and what you feel are its strong and weak points, and what you would like to see in a GUI, I would be most grateful.

If any of you would like to know the results of my analysis of the data I recive then I would be more than happy to mail the results to you.

This is an important part of the project and although I have data from people at the university I could do with data from a wider field of users and people. So in brief please do the following.

Press the button that will allow you to reply to me or mail me (Steve Jones) at

sgj-a@minster.york.ac.uk

And write a short note saying.

What Interface you use.

The machine you run it on.

What you feel are its good points

What you feel are its bad points

What you would like to see changed.

Then sign it if you want (all signatures will get an acknowlegement in the report)

Thank-you and Cheers in advance.

Steve Jones

3714. Does anyone use Ultrascript??

Newsgroup: comp.sys.atari.st
Date: 1993-03-06 08:06:40 UTC
From: baffoni@phakt.usc.edu
Message-ID: <1n9m2gINNl93@phakt.usc.edu>
Source record: 209156

With the impending purchase of my Atari Laser printer, I had found someone selling his Ultrascript program. After finally getting the laser printer I tried to run the Ultrascript program.

Looking in the manual, it clearly states that you need an Atari computer with at least 2MB of memory and you need an Atarl SLM804 printer. Now, as far as I know, the SLM605 is completely compatable with the SLM604. However, I don't know if the Ultrascript works on an Atari TT.

Also, I noticed that when I ran theprogram, it would say that a printer was not found unless I specified in the drop down menues both the resolution and the printer type. Now, this is what really confuses me. The manual clearly says that a SLM laserprinter is definately necessary for using the program, however, in the drop down menu of printers, there is NOT ONE listing for the SLM804 - there is everything from an EpsonFX80 to an HPlaserjet one listed, but not one atari printer. So, is there some hidden command I just don't know about to use it? There wasn't even an Diablo printer selection, so the diablo printer emulator was of no help. This is one heck of a confusion program!!!! BTW, I was using their own supplied test.ps to test it out.

If it matters, I have a TT w/4MBstRAM, TOS3.06, and a big hard drive.

Thanks for any help!!

-=MikeB

I have a version of tcsh 6.02 (linked with MiNT library pl 27+) which seems to work quite well. (But only under MiNT, I've mostly dropped the support for plain TOS.)

I initially did not intent to upload it because I'm currently condidering porting tcsh 6.03. However, as there seems to be interest in a working tcsh, and as I seem not to have the time to finish the new port, I changed my mind.

I'll upload tcsh 6.02 asap, but not before I have linked it with the next (upcoming) MiNT library PatchLevel (which will feature user-configurable automatic path name conversion for environment variables, something I regard a very useful feature for tcsh).

So please stand by till the next MiNT Lib pl comes out.

3719. Where Not To Use (UK)

Newsgroup: comp.sys.atari.st
Date: 1993-03-06 15:07:05 UTC
From: stuart@csc.liv.ac.uk
Message-ID: <C3H3Bt.9o2@compsci.liverpool.ac.uk>
Source record: 209158

Hello,
Re: all the stuff recently about who is the most useless UK Atari
Dealer, I'd like to nominate Ladbroke Computer, yes this is a rant, sorry.

I got a RAM expansion off them and to cut a long story short asked them to fit
it (it's for experts only with all the soldering involved).

I put the machine in their shop in person, and they said it'd be a week.

2 weeks later no machine I rang them and was told "The people who fit the
stuff to the machines forgot to put the disk drive back in." (This is a
single floppy FM, the disk drive is a bit fundamental.) But I swallowed it
and they said it'd be a few days.

1 week later, still no reply, I rang them and they said "The woman who sends
the machines out is off sick" (No-one else who works for them can lick a
stamp obviously.) Still I swallowed it, and they said it'd be a few days.

1 week later, STILL no reply, I rang them and they (honestly !! Wow !!) said
"We don't know why you haven't got it you'll have it on Wednesday".

And I did, (nearly 1 month late) BUT they didn't pack it properly and it was
damaged in transit. I rang them they said "We need a formal letter of
complaint urgently", so I sent them one straight away, then nothing.

2 weeks later I rang them again, and they said they'd lost my letter and I'd
have to send another. They were lying however, because the man from the
parcel carrier arrived with a photocopy of it the next day, he examined the
machine and said Ladbroke would be in touch.

1 month later, still nothing I rang, they said they were still waiting.

1 month later (again) I wrote (phone bills getting too high) and complained
to them. They said we'll pick the machine up, fix the case and return it to
you in two days. They picked it up (against my best judgement) and 2 weeks
later they've still got it.

I rang them, and it went out yesterday, they said...

So if you do use Ladbroke, make sure you have the patience of a saint and
that someone else is paying the phone-bill.

(i.e. you're better off fixing it yourself)

>movie during the compiles.

It ain't the fastest system in the world, that's for sure, but it would
have to be a pretty short movie.

>GCC is incredibly resource hungry.
>It will happily gobble up 8 megs of RAM and then go to work on any
>virtual memory and/or spare disk space lying about during a big
>compile. While this wouldn't be a real problem if the person was
>only interested in hello.c type programs, I'm assuming that anyone
>going to the trouble to get GCC is probably interested in bigger
>projects.

Yup, I've been compiling a project consisting of about 30-40 source
files. About 3000 lines of code all together. Not huge, but
certainly not hello world. Takes about 10 minutes to compile
everything. As I said, not the fastest in the world, but not bad
considering what I paid.

>I'd be curious to hear how this works out.

I'm curious as to why you insist on telling everyone that the ST
is so crap. You really don't know what you're talking about.

3721. MiNT, minixfs, gcc & gdb Summary

Newsgroup: comp.sys.atari.st
Date: 1993-03-06 18:15:06 UTC
From: gadget@dcs.warwick.ac.uk
Message-ID: <1993Mar6.181506.26860@dcs.warwick.ac.uk>
Source record: 209160

Hi,

Thanks to everyone who replied to my question. As promised, here is
a quick summary of the answers...

Accessing a minix filesystem from GEM, without MiNT running:

No one knew how to do this. At present, MiNT must be running to
access a minix filesystem.

gdb generating a signal 0 as soon as it runs a program:

Normal behaviour.

symbol tables for gdb:

Compile all files with -g to generate symbol tables in the .o files.
Link files as normal. Then use sym-ld.ttp...

sym-ld -o foo.sym /gnu/lib/gcrt0.o foo1.o foo2.o /gnu/lib/gnu.olb

(This is assuming your libraries are in /gnu/lib)
Then run gdb with...

gdb -e foo.ttp -s foo.sym

gcc using all available memory

gcc-cc1.ttp is set with a stack size of -1, which gets all available
memory. You can change this value with the fixstk.ttp program. The
following values can be used for the stacksize:

```
* _stksize meaning
* -1L keep all of memory (except MINFREE at top) and do
* mallocs from own heap, with heap grown upwards towards
* stack, and the stack growing down towards heap,
* with a minimum slush between them so that they
* dont meet (only checked while malloc'ing). With
* this model, further spawning is not possible, but it is
* well suited for programs such as gcc-cc1 etc.
* Thanks to Piet van Oostrum & Atze Dijkstra for this idea
*
* 0L keep minimum amount of memory. this is also the
* case when _stksize is undefined by the user.
* 1L keep 1/4 of memory, free 3/4 ( as in Alcyon GEMSTART)
* 2L keep 2/4 (1/2), free rest
* 3L keep 3/4, free 1/4
* other keep that many bytes
```

* -other keep |other| bytes, use the heap for mallocs

This is the only thing I haven't tried, so don't blame me if
it doesn't work ;-)

Thanks to all those who responded.

Cheers,

Steve

> boxe's performance won't be as good at DTD recording.

In the US, a Falcon030 4/65 (16Mhz '030; 4M RAM; 65M IDE hard disk)
costs the same as a _good_ '486sx/25 with 1024x768x256, 105M IDE hard
disk and 4M of RAM. It also costs the same as a Mac LC II (16Mhz '030;
4M RAM; 80M SCSI hard disk).

"Power without the price!" ceased to be true as soon as the TT was
released.

>
>

No, the 3DO units will NOT be dirt cheap due to competition.
Remember, EACH company still has to purchase the hardware from 3DO.

Rememer when PC manufacturer had to purchase Intel chips from Intel?
The price of PCs were very high. When other companies starting making
their own 286 and 386 chips, the price went down.

The only thing that will lower the price of the 3DO hardware is something
like the Jaguar.

>objects, distortion and special F/X out the wazoo -- the Jaguar supposedly
>can do all that, presumably thanks to the proprietary 64-bit graphics chip in
>the beast.

Be careful about your assumptions here. The 3DO hardware and
developer's kit comes with some very nice things that are more than just
tossing in a DSP here or a graphics coprocessor there. For example,
the 3DO has hardware and ROM code to do real time JPEG decompression.
This alone makes is very easy to do impressive animated sequences.
(You can do a 30-minute movie in better-than-TV resolution, for example.)

The 3DO comes with a CD ROM drive. It has software and hardware meant
to make accessing lots of data from said drive very simple. This gives
you 500M of data to play with. A 64-bit processing Jaguar isn't going
to do squat compared to the 3DO unless it can deal with this kind of
data (i.e., unless they plan to make the Jaguar a CD-ROM based machine).

Another plus for CD-ROM based systems which is unknown to most game
players is that CD's are far cheaper to produce than cartridges. If
the Jaguar is a cartridge machine, people won't develop for it instead
of the 3DO. (Carts cost $10 to $20 while CD's cost $1 each.)

Add to all this the fact that the 3DO developer's kit is said to come
with 100+ CD's of video clip art (aka stock footage)that you are free
to use in your games. (I.e., they've already gotten permission for
this.)

From a developer's standpoint, there's a lot more to a console machine
than just the hardware. Same story with computers. Atari has
demonstrated the ability to consistently lose with good hardware. I'm
not betting that the Jaguar will be any different in this regard
(particularly since they face a veritable armada in the 3DO
consortium), but who knows. (For the record, I do think that console
units are Atari's last hope before they fade away into complete
oblivion.)

>3. As for how confident Atari is in the Jaguar, I'll just pass the following:
>
>Insider: "The Jaguar could very well be the machine that 'makes it' for
> Atari".
>Me: "But they'll need promotion and lots of games at the start."

>Insider: (smiles, nods a lot)

The one thing Atari has never had a lack of, despite their pattern of embarrasing incompetence and failure, is arrogance. This is just like the bluster we heard about the Falcon. In fact, John Skrutch and Bill Rehbock gave me *exactly* that line ("The Falcon could/will be the machine that 'turns things around' for Atari") in July. Deja vu!

I find it extremely doubtful that a Jaguar can outperform a 3DO (except maybe in a price/performance comparison). The 3DO has a much better custom hardware for graphics than the Amiga and Falcon combined and multiplied by ten, so this would imply that the Jaguar would be even better than a Falcon by far.

3DO can move 36-60 million pixels per second, something which is quite astounding. Has 24-bit graphics and it seems that it can apply in real-time some rendering algorithms like surface mapping (limited), lightning, transparency.

What are the Jaguar's *REAL* specs? BTW, don't believe anything in magazines like EGM, I have found *severe* errors in their reports.

3729. TOS 2.06 mouse click doubling

Newsgroup: comp.sys.atari.st
Date: 1993-03-07 05:08:51 UTC
From: fsctc@avelon.lerc.nasa.gov
Message-ID: <1993Mar7.050851.23506@eagle.lerc.nasa.gov>
Source record: 209169

Everytime I click the slider bar on my window the screen moved, not once, but twice. Is this a bug in TOS 2.06? In particular I'm using Opus and this happens. It also happens with WordUp. My TOS 1.4 doesn't have this effect. Is there a patch?

>This is one heck of a confusion program!!!! BTW, I was using their own
>supplied test.ps to test it out.

I think that there are two versions of Ultrascript: one for the SLM804 and another for the other printers. When I ordered it a couple of years back I was sent the version for the 'other printers' and was confused too. Calling the dealer resolved the problem: he sent me another set of diskettes+ manual for the SLM804. I suspect that you have the 'other printers' version.

A word of caution: do not expect Ultrascript to handle all postscript files correctly. It does print a lot of things correctly but on others it just hangs...at least, my version does. It is irritating and I'm considering buying a real ps printer.

a> how the FALCON will do.

That's exactly what Atari is going to do. All support for other machines
has been dropped and they're waiting for the Falcon to become a succes.

If the Falcon however doesn't become a succes Atari will cease to exist and
will no longer support their range of computers... :-(

> to do squat compared to the 3DO unless it can deal with this kind of
> data (i.e., unless they plan to make the Jaguar a CD-ROM based machine).

Well, I don't know about that. Many experts say video games don't use
half of the cd's memory capability and probably never will. The only
thing its great for is the full motion video. Look at the vast amounts
of memory of the Neo Geo. They have 330M and have yet to make a game
over 106M. And seeing how good those are, I can't possibly imagine
one with say double that memory.

> Another plus for CD-ROM based systems which is unknown to most game
> players is that CD's are far cheaper to produce than cartridges. If
> the Jaguar is a cartridge machine, people won't develop for it instead
> of the 3DO. (Carts cost $10 to $20 while CD's cost $1 each.)

Its basically the ease on which to put a game on cartridge vs. CD.
Is it really gonna make a difference if Jaguars games are $60 and
3DO's are $45? On the other hand, since it costs a lot to put a lot
of memory on a cartridge (just look at the Neo Geo's game prices),
it may make a big difference.

> From a developer's standpoint, there's a lot more to a console machine
> than just the hardware.

A big difference IMO, will be the games offered,quality, and price.
You need a descent mix of those 3 to get anywhere now in the video
game market. Being the best isnt enough anymore if the system is
megabucks. And of course you need fun,quality software. I think
the 3DO's gonna do better than Atari's because its more realistic
so far. I mean, Atari wants to put a 64 bit machine on the market
fo under $100? Come on. I wouldn't believe anything under $200.
More realistically it will be $300 when it hits the shelves and have
high priced software.

3737. UNIX on the ST

Newsgroup: comp.sys.atari.st
Date: 1993-03-07 15:10:37 UTC
From: cabp09@uk.ac.strath.ccsun
Message-ID: <C3Iy5p.JJo@ccsun.strath.ac.uk>
Source record: 209175

I suppose this is the best place to ask !

After discovering that MINIX is a comercial package, I wonder if any
ST user out there has access to a FREE unix type OS ?

It seems a shame, coz I'm sure the ST is capable of running a nice little
UNIX sub-system rather than TOS. NOT as a replacement (I felt flames there !)
but just as an alternative development environment (ie to be CUTE !).

My pal has ported IDRIS to the ST, but I couldn't get it to work as I have
only 1 Meg of memory (aww). He told me the problem, but it was all way beyond
me !

So, any ideas or suggestions (other than the rude ones !) ??

Dave.

From chatting via email with several Falcon030 owners, I can say you're
wrong. Almost NO ST/STe games work, even ones that work on the TT.
Anything that tries to access the sound chip (ie, everything) dies a
horrible death.

> The way the video modes
> accomodate the old Atari monitors is very well thought out. Sure, some

But, even games that worked on the TT, which is less ST-compatible than
the Falcon is supposed to be, don't work, like Llamatron.

3741. Nethack 3.1 patch 1

Newsgroup: comp.sys.atari.st
Date: 1993-03-07 19:01:18 UTC
From: paetau@mits.mdata.fi
Message-ID: <1993Mar7.190118.594@prime.mdata.fi>
Source record: 209178

I just got myself the first patchlevel, hoping that some of the problems I encountered with the first version may have been removed. The colors were fixed, but I couldn't open my old savefile, Nethack told me "the dungeon suddenly collapses" and "can not get 1900??? bytes, program in disorder, pherhaps you'd better quit". I had 2.3 MB free ram when I started Nethack. I run it from a 1.5 MB RAM disk, if it matters. Also some character classes didn't work, ex. Samurai, which would produce 2 bombs when I pressed space after the intro-story. Another interesting thing happened when I decided to be a Cave man, I noticed that I couldn't move, and when I looked at the inventory, I had 1923547167 +0 bec de corbins. When I dropped them I could walk around though :).

So by posting this I just want to know if others have this kind of problems, or is it just me? BTW, what was the address to report nethack bugs to again?

I have the following items for sale -

1- Olympia NP compact 9 pin printer.
Has both serial and parallel interfaces - good workhorse of a
printer - also has NLQ mode - about 100 cps
Price: $100 or best offer

2- Atari ST - 4 meg memory and 16Mhz upgrade with mouse etc.
Price: $ 150.00

3- 2 800K SF314 floppy drives with power supplies
Price: $ 45.00 each

4- SM125 Monochrome monitor
Price: $ 100.00

5- SM1224 Colour monitor
Price: $ 100.00

6- Spectre GCR with 128K MAC ROMS
Price: $ 150.00 ---SOLD

7- Supra 30 Meg hard drive partitioned as 20 Meg MAC drive and
10 Meg ST drive - Tons of Mac software to use with GCR
Price: $ 200.00

I would prefer to sell all together if possible.
Prices are negotiable as is shipping

Did you know that the 040 Centris 610 is only $600 more in list price than the Falcon..Better yet, the LCIII 4/80 is $50.00 more in list price. The difference is that Apple has them now and Atari is having difficulty in getting one model to the market. I bet that the Falcon will not be released until September of 199?. In the mean time the Centris 610 will be priced under $1500 by June to make room for the new Cyclone line...

"Apple's Business plan for 1993: Double market share worldwide and that means Europe...Atari may be out of business in Europe or just an insignificant player"

this happens with some programs since TOS 1.04, with some not. Yes, this is
a bug. The best solution is to use GEMRAM 1.1 & ARROWFIX 1.3. This combination
fixes the bug, but needs ~130 KByte of Memory (the whole GEM has to be copied
into the RAM). On the other hand, you can add SHBUF 1.0 to have more system
memory for your NEWDESK.INF and WINX 2.0 to have some more windows with almost
no extra cost :-)

These four programs are written by Martin Osieka (Martin_Osieka@mz.maus.de)
and work perfectly on my machine (Mega ST4, TOS 2.06)

c>available.......

Well - there is the diagnostic cartrifge, which is very useful when the
computer is broken.

Then, you can attach two roms which act like a diskdrive when programmed
with the right software - my second, diskless ST boots from EPROMs at the
cardridge port, which then start up the MIDI network software. Currently,
this ST is used for Midimaze only, so when I switch it on, Midimaze is
automatically started from EPROM.

And last, you can attach nearly every do-it-yourself hardware to that
port, as long as it does not require DMA or interrupt capabilities - I
have build an IC tester which is connected to the cartridge port (however,
a real userport as the C64 had or - even better - a real expansion port
(like the internal Mega ST slot) is much better to handle).

Fate helps those who help themselves. You have nobody to blame but yourself. I'm sitting here in a small city about as far away from the rest of the world as it is possible to get and still have running water - the owner of one of only three TT's known to exist in this state.

I have _never_ wanted for software. Or hardware. Why? Because I get off my bloody ass and go find it. All this pathetic whinging from the sort who want to be waited on hand, foot and finger is becoming very tiring.

g> Amen to that. I've got a TT too, and while I am happy with it, I would
g> like to upgrade from the TOS 3.01/720Kb floppy I have now to
g> 3.06/1.44Mb. I mean I'd REALLY like to do it...really...I would...but I
g> can't. Don't think I haven't tried -- in fact I've been trying for, oh,
g> at least 6 months now.

Then you're making a pretty piss-poor effort at it, mate.

g> My local dealer has tried 2 different suppliers,
g> one Canadian and one American, but with no luck. The story he got was
g> that Atari is waiting until they get X number of orders before they
start
g> filling them. Well, thank you for nothin'.

And that's it? You haven't tried anything more? 3.06 is not easy to find, but there are any number of netters who have it - ever asked them where they got it? Politely asked them to do a dump of 3.06 to disk so you can blow your own copy?

And as for the upgrades - Epson SMD-300 or SMD-340 drives are easy to find. So are Ajax chips. Swapping the faceplate on your drive takes 5 minutes, a small phillips-head screwdriver and some patience.

g> Anyway, I finally got fed up with the whole thing and bought a floptical
g> (much to the delight of my local dealer, I'm sure, as it cost about
g> CAN$400 more that the upgrade). Now I'm happy. I can finally read
g> those pesky HD disks. I even backed up my ENTIRE hard drive. Imagine!

Yay. Not to say the floptical is a bad choice, but you really wimped out on that one.

g> Gordon Farrell
g> Wimp Extrodinaire

Seriously - wake up and learn to look after yourselves. Nobody else is going to do it for you - it's bad business practice.

3751. Spectre 128 <-> 720k ST floppy

Newsgroup: comp.sys.atari.st
Date: 1993-03-08 03:44:45 UTC
From: boyd@gauss
Message-ID: <C3Jx2L.73w@mailer.cc.fsu.edu>
Source record: 209189

I have been offered a Spectre 128 w/ROMs for a very good price. I have a Syquest, and intend to devote a couple of 44mb disks to Mac stuff. My question is, what programs are needed to transfer files back and forth between a real Mac and an ST (with a regular DSDD floppy drive)? My understanding is that Apple File Exchange can be used to read/write to MSDOS formatted DSDD disks, given that the Mac has a Superdrive (is that correct?). What programs can be used to go the other way? Is there a program that allows Spectre to read/write to MSDOS formatted 720k disks? Is there a program that will make the Mac read a Spectre formatted floppy?

I am trying to acertain whether or not the Spectre 128 is worth even the small amount of money that is being asked for. Should I plunk down a few more bucks and buy a Spectre GCR? I have a Mega2, so this may imply diddling around with the drive shielding (which I would like to avoid if possible, hence the questions).

Also, my plan for major Mac file transfers is to take my Syquest to a Mac, hook it up, and blam away. Then, take the Syquest home and hook it back up to my ST. As far as I can tell, there should be no reason why this won't work. Does anyone disagree?

Thanks in advance. I will post a summary if there is interest.

BTW, have anyone else noticed that the classic irritating PC user question, "Yeah, but does it run Lotus?", has been replaced with, "Yeah, but does it have a cool screen saver, like After Dark?". Warp 9, baby.

Hang on a tick - is this not the same engine that Bitstream 'lent' to the
MIT X project? If so, does it not support the PS1-Adobe font format?

Incidentally, I'm quite happy that atari didn't decide to buy TrueType or
ATM - both are about as useful and functional as the QMS-Imagen engine they
used in the original FSM-gdos.

> l <--- the 'l' that fell off of the "well', above!

Welll [:-)], C= are now producing computers that use a *cut-down* version of that 68020 (EC020) running at 14MHz! And if you're going to mention the A3000/4000, well, the TT has been out for almost 3 years... It's not the microprocessor type/speed that counts, (at least if you're not in the Intel department) but the overall performance and value for money of the machine!

There's a mirror of a.a.u.e. at src.doc.ic.ac.uk, hidden away as the directory
"/packages/atari.umich".

I've only tried it using ftp. If you're stuck with ftping by mail, sending the
command "get README" to the mail address "ukuug-soft@doc.ic.ac.uk" should get
you started.

Cheers

By far the easiest solution is to use PC-Access, a Cdev for the Mac. This
will allow you to format DOS-disks from within Spectre, and to read and
write DOS-disks. Since the Atari can read DOS, your problems should be over.
(In fact they *are* over in my experience -- and I have a Mega2 too :).

>Also, my plan for major Mac file transfers is to take my Syquest to a Mac, hook

3765. Atari kit for sale in UK.

Newsgroup: comp.sys.atari.st
Date: 1993-03-08 12:24:30 UTC
From: william@summer.bt.co.uk
Message-ID: <13750.9303081224@sun3.summer.bt.co.uk>
Source record: 209196

I'm changing my computer system, which leaves me with a lot of
Atari kit. I am prepared to sell the lot for 450 pounds, or to sell
it piece-meal.

4M Atari STe (with Forget-me-clock) 200 pounds.
Progate 50DC II, 50M hard-disk (under warranty) 200 pounds.
Monochrome monitor 70 pounds.

Calligrapher Professional (v2) 50 pounds.
Various cover disks (including Timeworks, Knife ST, GFA Draft, Cyber paint,
Protext v4.3, ...) 15 pounds.
Tons of PD thrown in for good measure for nothing.

I also have a few books on ST programming (GEM programmers guide, ST machine
code (2 books), ST 3D graphics..) 30 pounds the lot. The books aren't
included in the bundle.

Ring me on 0473 645694, or e-mail me at william@summer.bt.co.uk.

3766. Hold and Drag v. Discreet actions

Newsgroup: comp.sys.atari.st
Date: 1993-03-08 12:40:08 UTC
From: sgj-a@minster.york.ac.uk

Cross-posted to:
comp.sys.mac,comp.sys.atari.st,comp.sys.acorn,comp.sys.mac.hypercard,comp.sys.mac.app,comp.sys.mac.apps

I have done a number of experiments and have noticed that many
users (especially naive users) would prefer to click to start and action,
then move the mouse, then click to terminate.

On most systems Move and Reshape actions are done by pressing
down on the button moving the mouse and then releasing the button. Some
systems also require the user to use this set of protocols when selecting
items off menus.

My final year project at University is on GUI's and I asked for
peoples opinions on the GUIs they use. One reply I recived suggested that
more specific questions may be helpful. So the question is this (please
feel free to reply to the previous posting as well as this has begun
to get some interesting replies):

Do you prefer the hold and drag set of protocols or a discreet set of
seperate actions (ie click, move, click) ?

Please mail me (Steve Jones) at

sgj-a@minster.york.ac.uk

with your answer. If you want to know the results of the survey please
say so and I'll mail you a copy when I have analysed them.

Thanks in advance

Steve Jones

Nooooo!

1) The Pet Shop Boys are still going (bless 'em)
2) Electronic is Bernard Sumner (of New Order) and Johnny Marr (ex The
Smiths; also involved in The The)
3) The Pet Shop Boys have guested (at least) twice on Electronic singles.
4) New Order now have their own label on London Records (RIP Factory --
you'll be missed) and plan a single release on 5 April.

[More deleted]

Why are we discussing this in comp.sys.atari.st ?

Don't purchase hardware from the pd/shareware company, 16/32 of Kent.
I don't particually want to go into the details but lets just say
they gave me a hard time.

I think they should just stick to the software side of things rather
that being the middle man when it comes to hardware.

Message-ID: <1993Mar8.145526.9029@unix.brighton.ac.uk>
Source record: 209149

I think the 1.44 mb upgrade is the way to go. If your internal drive is going
then it is pointless getting an external one, cos you can only boot from drive
a unless you use a software patch which will need to be loaded from drive a.

Bear in mind that the falcon uses 1.44mb and so it will soon become more stanmdard to use
it.

No idea about flopticals IO am afraid, but I expect they will work fine
since the falcon has a scsi II port. But the s/w to drive it (if it needs it?) may not
work.

For those that get upset easily, I apologize in advance for such a "brazen commercial post" on the net but users requested a short announcement so...

Fair Dinkum Technologies announces the immediate availability of Atari FALCON030 COMPATIBLE versions of the following software:

Cyberdrome-The Hoverjet Simulator
The unique 2-player/2-computer action/adventure simulation.

Crossword Creator II
The premier crossword puzzle utility for Atari computers.

Word Search Creator
The premier word search puzzle creation utility for Atari computers.

Yes, all the above are also ST, STe, and TT compatible. More info is available upon email request.

We now return you to your regular flamefest scheduled for this time...

>is there anyway to chain them together using STOS or GFA BASIC ?
-
Sometime ago I put a collection of pictures into one PRG using STOS.
The sequence is available on ST Erotica #1. It was about 40 NEO
pictures and the PRG came to around 200KB.
Now it is done:

Compact pictures using the COMPACTOR on STOS.
Put all pictures into one huge file, keep on a piece of paper the numbers
where each picture starts and stops.
Load the huge file into a bank. Lets say BANK 11.
Then copy each part (You know where each part starts and ends from each part)
to a new BANK (Lets say BANK 6).
Unpack files from BANK 6 to screen.
This method is not too fast. I guess you can unpack all the pictures to
keep the rate flowing fast enough.

Another method:

Send the NEO pictures to me. After a long battle, I've written an NEO->SEQ.
(No its not PD, its for my use only). I've also tried to write an
Amiga ANIM->SEQ but I get garbish results after the 10th frame or so. So
it still does not work. Just send me a message before you send Megs of files.

Special Edition Friday Night Real Time Conference
March 5, 1993

Dateline Atari! with Bob Brodie
Special Guest - Eric Smith

Host - Lou Rocha

Once again it is my great pleasure to welcome Bob Brodie,
Director of Communications for Atari Corp. to our monthly edition
of Dateline Atari! We also have the added honor of a special guest
- none other than the original author of MultiTOS, Eric Smith!
Welcome to both of our guests.

This is a special night for Atarians for another reason. Tonight
we expect to hear the long awaited news of Falcon030 shipping
plans and US prices. For several months we have followed the saga
of Falcon production and related software development. Last month
we got an excellent preview of Atari Works, the integrated
wordprocessor, database and spreadsheet.

Tonight we will hear about the long awaited (almost legendary)
debut of MultiTOS - Atari's multitasking operating system. Without
further ado, let's have the opening comments from Bob Brodie. Go

Ahead, Bob! Lou and the rest of the gang here at the ST Roundtable!

Once again, I'm delighted to be here for our monthly gathering at Dateline: Atari! This month, I'm pleased to offer something a little bit different from our normal fare. I've asked Eric Smith, from the Software Engineering Group here at Atari, to join us online to discuss MultiTOS. I know that you're all very anxious to hear as much as possible about the capabilities of MultiTOS, and Eric is just the man to answer all of your questions about MultiTOS. As many of your may know, Eric developed a program called MiNT (which stood for Mint is NOT TOS). Originally, MiNT didn't multitask with GEM applications, but rather gave users a multi-tasking environment to operate TOS applications from. MiNT is now incorporated into MultiTOS, and has changed dramatically since Eric first wrote it. Obviously, we were impressed enough with his efforts to offer him a position within Atari!

Before we begin with the MultiTOS portion of our CO, I'm sure that you are all very interested in the status of the delivery schedule for the Atari Falcon030 here in the US. We have had a small setback in the manufacturing of the unit. One of our suppliers is running about 10 days behind in providing us with a couple of components that we need for the US machines. This means that the machines will probably arrive in late March to early April.

The reception that we've had for the machines has been nothing short of sensational!! The phone has been ringing constantly, with many people interested in signing up as Atari dealers. As you might expect, the main interest is coming from the music field, as few other computer systems can match the digital sound capabilities of the Atari Falcon030 right out of the box!! We have enough orders in hand that we expect to be sold out quickly. This is the same type of reception that the Falcon030 has gotten in the rest of the world, for instance in Germany, where it was literally sold out in a matter of hours!!!

Much of our efforts here in Sunnyvale over the course of the last month has revolved around finalizing plans for dealer agreements. It is our hope that we'll be able to restore the value of an Atari dealership, and help the dealers be able to be more profitable. We will be soon going over the new arrangements with all of our current dealers, as we release the pricing, and other sales related information to our current dealers.

Now, we'd like to tell you a little bit about MultiTOS! While this file is a little bit long, it will give you a pretty good idea of what the capabilities of MultiTOS are.

MultiTOS provides your Atari computer with multitasking, the ability to run more than one application at a time. Since your

computer spends much of its time waiting for user input, multitasking makes more efficient use of processing power--when one application, say, your word processor, is waiting for input, the rest of your computer's attention is turned to other tasks.

MultiTOS includes several important features that make multitasking reliable and efficient. Adaptive prioritization gives the most processing power to the most important program running--the word processor you're typing into receives higher priority than the processor-hungry compression program running simultaneously in the background. Memory protection prevents one program from interfering with another active program's data in memory. And if one program quits unexpectedly or "crashes," MultiTOS protects other applications, which continue to run; only in the most extreme circumstances will you need to restart your computer.

MultiTOS runs existing, correctly-written TOS programs--as many as your computer's memory allows. Some programs are already being upgraded to take advantage of MultiTOS features, and more programs written especially for MultiTOS are on their way, from Atari and third-party companies.

MultiTOS can run as many programs simultaneously as will fit in memory; GEM programs, Desk Accessories, and TOS programs can all peacefully coexist under MultiTOS. You can move from one to the other, using whichever you need. When one program is busy, you can set it aside and work on something else until it's done. When you finish with a program and exit it, the memory it occupied is freed for other tasks.

All running programs share the screen, each putting up its own windows; with several programs running, windows may overlap or be hidden altogether by one another. The application that receives input, like keystrokes, from you is called the foreground or topped application, and other programs running simultaneously are background, or untopped applications.

Unlike TOS, MultiTOS allows you to operate any window's gadgets to move, resize, or scroll the window, even if the window is not topped. When you click within a window (but not on its gadgets), that window is topped, and so is the application that owns it. The topped application's menu bar is displayed, unless it doesn't have a menu bar--in that case, the menu bar is unchanged.

Running GEM programs under MultiTOS is straightforward: simply double-click the program's icon. The MultiTOS Distribution Kit includes two simple GEM programs, "Clock" and "Lines." Double-click on CLOCK.APP, and an analog clock appears in a window, but the Desktop's icons and menu bar are still visible. Double-click on LINES.APP, and a graphics demonstration appears in a window. Resize the Lines window so that you can see the clock and some of

the Desktop. Both programs and the Desktop are running simultaneously! From here, you can run still other programs, or perform Desktop operations like file copies.

Desk Accessories and MultiTOS

As with TOS, you can access your Desk Accessories from the "Desk" menu. Unlike TOS, MultiTOS can load Desk Accessories as you need them. Double-click on a ".ACC" file to run it, just as you would another GEM application. You may want to keep only the essential Accessories loaded at all times, and load others when needed. You can do this by putting your ".ACC" files in a directory other than the root of drive C:\.

TOS programs present a special problem for multitasking, because they usually assume they are the only programs running, and that they have the whole screen to themselves. Since TOS programs don't know how to share the screen, MultiTOS does it for them, by giving them their own "screen," within a window. When you double-click a ".TOS" or ".TTP" program, MultiTOS runs another program, "MINIWIN," which sets up a window in which the TOS program runs. MINIWIN lets you select the size of the window TOS programs are given, and the font they use. You can change this information by choosing "Configure..." in the leftmost menu when running a TOS program. Note: TOS programs assume they're using a "monospaced" font, where all characters are the same width. MINIWIN allows you to choose "proportionally spaced" fonts, where a "w" is wider than an "i," for example. If you choose a proportionally spaced font, the program may look strange, but is otherwise fine.

When several applications are running, the topped application presents its menu bar and receives your keystrokes. The others are in the background, where you can still move and resize their windows, but you can't click on their menus or give them keyboard commands. MultiTOS provides several ways to manage all the applications you may have running, and to choose which of them is topped.

The leftmost menu in the menu bar is called the "Desk" menu, because that's what it's called when the Desktop is topped. When another MultiTOS-friendly application is run, and the application has its own menu bar, the application's name replaces "Desk" in the menu bar--this is one way to tell which program is topped. Some older applications will not do this, but will otherwise work fine.

The Desk menu contains the names of all installed Desk Accessories and below, the names of all applications currently running, with the topped application indicated by a checkmark. You can top another program by clicking on its name in this menu; its windows (if it has any) spring to the front, and its menu bar (if it has one) appears.

You can run as many programs as your available memory allows, but there are reasons why you may not want to. Often, there is very little difference in system performance with several programs running, since many of these programs are just waiting for input. When programs are actively processing, or reading and writing data on a disk, they consume more of your Atari's processing power. You may be tempted to leave things running in the background because it's so easy, but if they make too many demands on the system, performance will suffer. It's best to shut down any programs you're not planning to use, just as you would exit them in TOS. This makes the most memory and "computing horsepower" available for the programs you really need. Experiment, and see what combinations of programs work well together.

Shut programs down with MultiTOS the same way you would with TOS: save whatever you're working on, then select "Quit," click the "close" gadget on a window, type "exit," or whatever. This gives the program a chance to save and close any files it has open and exit cleanly, returning your computer to its normal state. As always, it's best to save your work and exit from all running applications before restarting or turning your computer off.

Occasionally, a program may "hang" in a state where it is no longer running correctly, but does not exit. When this happens, you can shut the program down from the Desktop. Select "Install Devices" under the "Options" menu, then open drive U:\, and then the "PROC" folder. This folder contains "files" that represent all the programs currently running under MultiTOS, along with parts of MultiTOS itself. To stop or "kill" a program, simply drag it to the trash. Be very careful with this technique. Kill only programs which have not responded otherwise, or are otherwise behaving incorrectly. Be careful what you throw away, because it is possible to shut down a part of MultiTOS itself, after which it can be difficult to recover without restarting. If you aren't sure what something is, don't kill it.

Although Atari has made every effort to accomodate even ill-behaved TOS programs, you may occasionally encounter programs that are not compatible with MultiTOS. These programs may "crash," (exit unexpectedly) or "hang," (keep running without accepting input, refusing to exit). Usually when this happens, MultiTOS continues unharmed, along with any other programs running at the time of the crash. Sometimes, if a program crashes in an especially spectacular way, it can interfere with other parts of MultiTOS operation, or other programs. If you see error messages on your screen, or if you notice peculiar behavior from other programs, save your work and reboot your computer. Try to isolate the problem to the particular program and action that caused the crash, and report the problem to the program's authors or publisher.

When you encounter a program which doesn't run under MultiTOS under any circumstances but you need to run nevertheless, you can temporarily disable MultiTOS, and restart your computer with TOS. To do this, save any work in progress, shut down any running applications, and restart your computer. You can use the Reset button, or hold down and and press .
Immediately after restarting, hold down the left key. You will be asked, "Load MultiTOS? (y)es (n)o." Press the key, and your computer will start up without MultiTOS.

With the power of MultiTOS comes responsibility. Since some older programs expect to be the only thing running, they may not guard against some things which can happen "when their backs are turned." You can avoid these problems by not using one program or the Desktop to interfere with another active program. For example, don't move configuration or open document files for your word processor while it's running; the program may assume the files are in their original place, and behave unpredictably. Similarly, be careful with programs that manipulate disk data directly; don't run a hard disk defragmentation program in the background and save a file to the same disk, or the results could be unpleasant. As more MultiTOS-aware programs become available, these problems will be minimized.

That concludes our opening remarks about MultiTOS, Lou. We're ready to take on all the questions that our guests might have tonight! Naturally, we're prepared to answer MultiTOS questions as well as almost anything else they might want to discuss with us.

Thanks for the preview of MultiTOS. Several people have their hands /raised so let's get to them right away. Our first question is from B.AEIN. Go ahead Bman...

<[Bman] B.AEIN> Bob, can you talk about new dealers, the Falcon 040, or the Jaguar? Will there be coverage in mags like Popular Science? What extras will be included with theFalcon? MTos on ROM? Thanks for being here Bob. GA!

Hi Bman, we've gotten a number of enquirys from new dealers. I expect to be able to expand our dealer network dramatically, and quickly as well. Among the most exciting thing to the new dealer prospects is the fact that they will actually make MONEY selling Atari Computers, unlike the skinny margins that most clone dealers presently have to live with. Re the Falcon040: Sorry, no comment about any 040 products. The Jaguar, our 64 bit game console machine is due out this summer. The Falcon will ship with MultiTOS, Atari Works, Speedo GDOS, and the other 8 applications that we previously indicated.

Thanks Brian. Next we have Dave Shorr.

<[Dave] D.SHORR> Bob, what is the STatus of the dealer demo unit program and Atari's service agreement with GE? GA.

The dealer demo program is going to happen, naturally dependent on the dealer accepting our new dealer terms and conditions. as for the GE program, there are legal issues that are impeding that event from going forward. Unfortunately, I don't know when it will, or if it will happen. However, the Falcon030 in reality only has about 6 components to it: The ram board, the floppy, the hard disk, the power supply, the keyboard, and ... the motherboard. This makes it very easy for just about anyone to be able to service the Atari Falcon030. ga

Thanks. OK Steve Miller has been waiting. GA

<[IRATA native] S.MILLER58> Will MultiTos have the capability to open an individual application multiple time? And will there be a unix style command line capability? Or is MultiTos far from being anything like UNIX running an x-windows type of envir.? and when it is going to be available ?

<[Eric Smith] ST-GUEST> Yes, you can open applications multiple times (assuming the application supports this; most do). You can use most of the available command line interpreters for the ST under MultiTOS, and they will run (like any .TOS or .TTP window) in a window. Much like xterm under X windows, if you're familiar with that. MultiTOS is going to ship with Falcons, and will be available for users shortly aftwerwards. ga (By "users" I meant "non-Falcon" users, obviously).

<[IRATA native] S.MILLER58> Will, MultiTOS support SLIP so that I can use my DECstation's graphics capabilities at home? err if I used the terminology correctly.

<[Eric Smith] ST-GUEST> We don't have SLIP support build into the OS, but people could add this on with easily, using MultiTOS's loadable device driver and file system features. ga

Next we have Chris Cassaday

<[Fiesta Atari] C.CASSADAY> Bob or Eric: TOS and TTP programs sound like a pain. How do programs like ARC Shell and XYZ shell work under MTOS? Concerning the desktop environment while running several apps: Does the [B]ottom to Top feature of TOS 3.06 work on windowed applications like it would on normal directory windows? Also, can you use the right mouse button to manipulate applications in the background in the same fashion? ga...

<[Eric Smith] ST-GUEST> Older versions of ARC shell didn't work under MultiTOS, but perhaps there will be a new version that does. The [B]ottom to Top feature works only on the desktop's windows; there is a new key (control-alt-tab) for cycling between applications. Some applications (MultiTOS aware ones) will let you manipluate them while their in the background; for these

applications you don't even need to hold down the right mouse button, it all happens automatically! GA

You look pretty comfortable there, Eric! Ready for JCD from NewDimensions?

<[JCD] NEWDIMENSION> Evening Bob. Has Atari decided on how MultiTOS will be distributed to owners of current Atari computers? MultiTOS is running GREAT on our TT and Mega STE. Congrats to Eric on a job well done!!

<[Eric Smith] ST-GUEST> Thanks, JCD

Jeff, it looks like we'll have to sell MultiTOS rather than ... upload it to the online systems. We have an arrangement with... DRI that requires that we pay a licensing fee for the use of GEM on a per unit basis. So we will be working on packaging and of course, pricing for MultiTOS in order to sell it to the user base so we can honor our contract with DRI. ga

Bob, we now have James Vogh

<[James] J.VOGH> I have a MIDI question. Is there any software which will allow the falcon to have the capabilities of a sound module such as the Roland sc-55? Ga

James, I'm afraid that I'm not familiar with the capabilities of the Roland sound modules, and our music expert James Grunke isn't in the office at this time. I'm afraid that I'm not up to speed enough to answer that. My gut reaction is that it is possible, but I don't think that there is such an application at this time. ga

OK, now we have Robb Albright

<[Robb/PAC prz] R.ALBRIGHT7> Eric, is there a feature in MultiTOS to allow minimising of running-program windows, and if so, what does it require of the program to allow this to happen. ga

<[Eric Smith] ST-GUEST> No, minimization isn't built in to the OS. However, we will be publishing a specification soon to allow programs to do this. Basically, your program should just make its window very small and move it to a corner of the screen. There are calls to allow you to check to see if any other windows are at a spot, so that you can find an empty place. GA

OK... John Kuehn.. you're on

<[John] JKUEHN> Bob, What is the current status of Atari Kodak and the Photo CD?

John, our contract is a done deal. We're awaiting the final versions of the developer tool kit which is being ported to our platform by one of the developers from Germany. We had

expected to see something in about January time frame, but there have been delays on his end in getting the product finished. Naturally, we're very anxious to see this completed. ga

<[John] JKUEHN> Also will the multitos package come with .XFS CD-ROM drivers? I Kodak developing the tool kit?

<[Eric Smith] ST-GUEST> No, the MultiTOS package will not come with the CD-ROM driver. It will be available later as an add-on, I think.

(Ed. Note - Due to a system problem, ST.LOU was disconnected and back up RTC sysop Mike Allen assumed RTC leaderhip.)

Well, let me finish up the question that John asked,
and lets' try to keep a QUIET demeanor in the next few minutes.
John, in answer to your question about Kodak...They provide the source code to the Photo CD software system. From the source code that they have provided, we port the code to our platform. This is the very same procedure that is done with the port to MS-DOS, and to the MacIntosh platform as well. Mike, take it formal, please. :)

Sorry folks - I don't have Lou's raised hand list.
I'm going to have to fake it for a while. hold on while I get a piece oof paper Ok, I have Craig Servin with his had up as well as a few others. Go ahead craig

<[Craig Servin] C.SERVIN3> Is the new Desktop smart enough to deal with longer file names? Also does MTOS give the 3D AES gadgets to TOS < 4.0 machines? ga

<[Eric Smith] ST-GUEST> The desktop doesn't deal with longer file names yet (future releases will, I hope) The 3D gadgets are built into MultiTOS and will work on all machines. GA

Next is A. Warner

Thanks Mike, Good Evening Bob and Eric My question is
: If delays continue to persist will the Multi-Tos and other New Atari programs ship? ga Sorry I meant delays with the Falcon

MultiTOS is on the machines that are coming from the
factory. We indicated that in the beginning of the CO, sorry you missed.. it. ga

S.Miller

<[IRATA native] S.MILLER58> How much memory will I need to _realistically_ run multiple apps.? The reason I ask, is I use PageStream a lot on my 4 meg TT and it seems to GOBBLE memory. So, will I be looking at upgrading to 8+ to mt btw PS and other programs? and does it look like any virtual screen programs are going to work with MT? GA

<[Eric Smith] ST-GUEST> Obviously it depends on the applications. I would think that if you're already finding 4 megs tight, then upgrading to 8 megs is a good idea. 4 megs is pretty much the minimum for doing "serious" work. And yes, most "virtual screen" programs work with MultiTOS. GA

Next is Sean from TWS

<[Sean@TWS] S.DOUGHERTY1> Good Evening Bob & Eric, Does MultiTOS allow manual adjustment of the priority, and does it display the current priorities? Does the HD on the Falcon030's contain demos of software? Lastly, do windows that are inactive still update? GA

<[Eric Smith] ST-GUEST> The priority can be adjusted "manually", but that isn't available on the desktop; I'm sure some enterprising developers will release software to do it :-). Windows that are inactive can still update, yes. Falcons ship with a variety of applications (which work both with and without MultiTOS). GA

Re the demo software... We will have a separate arrangement with our dealers to get them

<[pat] P.FORISTER> Bob, can you tell me a little bit about the surround sound capabilities of the Falcon? GA

Pat, most of that is not directly dependent on the Falcon, but rather on the specific application that is running on the Falcon. For instance, the Audio Fun Machine application that we ship with each Atari Falcon030 uses the DSP chip to create a surround sound type of effect. This is a capability of the DSP that is documented, and available to anyone wanting to create those types of effects with their Atari Falcon030. ga

Chris from San Antonio is next

<[Fiesta Atari] C.CASSADAY> I've been wondering about this particular question for a LONG time. With MultiTOS, will it be better to run STalker as an .ACC or a .PRG? Will the 'Favour Concurrency' option help at all? For the new AES 4 icons features, is a new icon editor being written by someone? And finally, is it now realistic to think of a TT030 as a file server in a LAN using MTOS and Dragonware networking software? Seems like a tremendous opporunity to sell Atari LAN set-ups with things like Atari Works to use in the office environment. ga...

<[Eric Smith] ST-GUEST> I run STalker as a program. It seems to work very well. (I'm not sure what difference the "Favour Concurrency" option makes; I haven't felt the need to try it . I haven't tried out the Dragonware networking software, so I don't know whether it would work well or not. GA

Next is James

<[James] J.VOGH> I have a lynx question When will Eye of the Beholder be released? GA

James, I don't have a specific date for it at this time, only that it will be available later on this year. Sorry I can't be more specific for you at this time. We do expect to have more games coming out for the Lynx at the rate of one to two titles a month throughout the rest of 1993. ga

now for our favorite archivist, CHARLIE.

<[Charlie] ARCHIVIST> Hi Bob and Eric! I have two qestions for you, not related to MultiTOS, as much as I'm panting for it. Sounds like you've done a super job Eric, Thanks! First Question, whats the status of MetaDos 2.0? we had someone looking for it, and I know I'm eager to see it. GA on that one

Charlie, I think it's a done deal, and we licensed it to ICD in order for them to release it with their HD utilities. The problem on our end was that the Atari host adapter didn't support the full SCSI command set that was needed in order to be able to utilize the CD roms. Since ICDs did, and their software/hardware is so popular, it seemed like a reasonable decision to make. We'll have CD ROM drivers for MultiTOS. ga

<[Charlie] ARCHIVIST> Oh that's what happened to it. I knew the Link handled CD-Roms but I thought there was an Atari program still pending. Ok, second question, I have a nice idea for a semi-regional marketing thing. who should I contact to pitch this at with Atari Canada sonambulant ga

I'd approach a fellow Canadian who's residing here in Sunnyvale right now. His name is Garry Tramiel. :) You can fax him at 408-745-2088, or send Snail mail. He won't come on-line.....YET. ga

Now tim @ aeo who has been very patient.

<[Tim@aeo_mag] T.WILSON14> Hi guys, ok, kinda a two parter - one, does atari in general have plans for ethernet ports or options on their machines in the future, and how about sockets or tcp/ip in multitos.

Hi Tim, we'll both answer this one. Re the Ether net ports, not on the current machine, although there are parallel and SCSI ethernet adapters that can be used with the Atari Falcon030. All that is needed is for software to be created to know that it is there. We've discussed doing such a project here, and there is of course, also the enterprising Chris Latham at Power Point Technology (PowerDOS) that is very capable of doing such a project. I'll let Eric handle the TCP/IP stuff...ga

<[Eric Smith] ST-GUEST> As I mentioned, it's easy to add new devices or file systems to MultiTOS; they can be loaded at boot

time. I've heard that some people in Germany are in fact working on tcp/ip software using this mechanism; no doubt some other developers are too. I don't have any dates or future details, though. GA

Now for B.Carnahan

Eric, Can a GEM app running under Mtos switch screen rez without confusing Gem in using AES functions? Ga

<[Eric Smith] ST-GUEST> No, because other applications that are running would still be using the wrong resolution. We have published a way to cause a resolution change, but it requires shutting down all other running applications, so it's not really a "nice" thing to do. GA

And heeeeerees DOT

<[Baaad Dot!] D.A.BRUMLEVE> ST Format has recently reported that some 150 leisure devs in the UK are working on Falcon games. Any truth to this? If so, when will the first ones be out?

Dorothy, I cannot confirm the exact number of developers in the UK that are working on the games, that's more Bill's area... and he's snuck of to his home for the evening. I can tell you that at the last meeting we had, he did say that there were over 35 Falcon "capable" games, that would use DSP sound, etc, that were on target to be delivered in June of this year. ga

Here is Chris from Texas again

<[Fiesta Atari] C.CASSADAY> Bob, so... MTOS won't be available until after the Falcon is available? I'm REALLY looking forward to purchasing MTOS. (If you couldn't tell already.) _Any_ idea of pricing on Atari Works, SGDOS, or MTOS? ga..

Chris, at this point that is correct. MTOS won't be out for the other users until after the Falcons hit. I'm pleased to hear that you are so interested in getting it, though. The pricing for Atari Works/Speedo GDOS is set. The suggested list price for Works with Speedo GDOS and 14 Bit Stream fonts is $129. The price on MTOS hasn't been set yet, but I'm sure that it will be under $100 US. We will also be selling a HD kit for Falcon030 buyers that don't opt to buy the HD version as an original component, and that HD will come with MultiTOS, Works, and Speedo GDOS installed on it. GA

Bob when/where can I get the AW/Speedo package? I'd like to support my dealer and can I trade gdos 1.1 in ga

Mike, it looks like we're about 30 days away from shrink wrap on Atari Works, and it will ship with the Speedo GDOS/font set up that I descriped previously. It really does look

great, and I'm sure that you will be pleased. I've abandoned every other word processor that I ever used, I'm really, really happy with the capabilities of Atari Works. We'll probably be having a CO with the author of Works, Pradip, in the next few weeks here on GEnie. ga

Now for Sean@TWS.

<[Sean@TWS] S.DOUGHERTY1> How do other applications see the U:\ directory, and what would happen if one attempted to load a task into say, Atari Works or 1st Word? GA

<[Eric Smith] ST-GUEST> Drive U: looks to applications like any other drive. If someone tries to load a process into Atari Works or 1st word, they would see a whole lot of garbage in their window :-). (Actually, a sensible word processor would pretty quickly figure out that this wasn't a proper document...) GA

Next is Brian, a fellow RTC sysop

Hi Bob and Eric!!!! I have two quick questions. A developer in the BBS stated that the TT is cancelled and this is the reason why he is not continuing with a product for the TT. Is the TT gone???

Second, is the new developer contract out to dealers??? Thanks. GA. Brian we have only a few TTs left in stock at this time, and the amount of interest in the product has dropped dramatically as the Falcon030 comes closer to the actual shipping date. We would be very happy to continue producing TT030s, as long as we have enough interest to make it worthwhile to fire up the production lines. If there isn't sufficent interest, then it doesn't make any sense to produce say, five thousand TTs. Re the new developer contract to dealers, I think you mean the dealer agreement to dealers...we don't have any reason to send the developers agreement to the dealers! :) The dealer agreement will be going out next week via our rep firms. ga

And now the Doctor is IN.

<[Dr. Bob] W.PARKS3> First off, Thank you guys for staying so late- Don't worry, though, there's not much snow on the roads :-) Will the Falcon ship with: a) a VGA monitor adaptor b) a ST monitor adaptor c) both d) that's Bill's area :-)

e) or a composite adapter f) none of the above. The video adapter is a separate item that will be purchased at the time of the sale by the customer, and HIS choice will depend on what he wants to do with his Falcon030. ga

next is Chris

<[Fiesta Atari] C.CASSADAY> Just wondering... Specifically, do Aladdin and PageStream co-exist peacefully under MTOS? Seems like

I could be doing a user group newsletter right now... [;^)

<[Eric Smith] ST-GUEST> Aladdin has a nasty habit of locking the screen; while the screen is locked you can't get to other applications. But otherwise it works fine (i.e. there's no damage done, and once the screen is unlocked you can get to your other programs). So I would say the answer is probably "sort of". I haven't tried that particular combination yet, though. GA

I understand that there is a version 2.0 of Aladdin coming that should be friendlier with MTos. Next is S.Miller

<[IRATA native] S.MILLER58> how will we go about getting MT? I would like to get a copy _the_ day it is realeased, even if I have to drive to San Jose to get it. It's only 180 miles from me. And is SGDOS easy to set up and use? ga

We will be selling MultiTOS to our dealers, so you will be able to order it from your dealer with little problem. Speedo is very easy to use. There is a diskette with an install program that works just fine, and prompts you through about four disks to install your printer driver, and the .ACCs for the fonts and the printer drivers. ga

<[IRATA native] S.MILLER58> I have a dealer here in San Luis Obispo, but he told me just the other day he has had _NO_ contact with atari corp. What about that kind of thing?

Who's the dealer?

<[IRATA native] S.MILLER58> Computer Logic

I have a feeling that he is buying everything from one of our distributors, Pacific Software Supply, which by coincidence, is also located in San Luis Obispo. :) He'll probably be able to continue buying product like Works/Speedo from him.

BTW, we had Travis Guy, our editor of Atari Explorer Online just run the PageStream/Aladdin combo. Worked fine, as long as he ran Aladdin first. He said that PageStream likes to grab most of the ram right away. :) ga

Next is K.Richard.

About optional HD will it be available in different megs??ga

Yes, basically it will be in 80 meg, 120 megs, and 200 megs. The price will vary according to market conditions on the HDs. Virtually all of the machines that have been ordered at this... point have been 4 meg/65 meg machines, so that's what the initial shipments will be. Probably in April or May, I don't have a copy of the production schedule in front of me. To be sure, we

want to supply the users with the one meg machine as well, and also make it easy for them to get the HD kit in a sensible fashion. BTW, did I mention that we're thinking of a Four Meg/No HD combo? Some of our dealers have thought that it would be a good offering to have in the product line. ga

How about a 14 meg no HD combo? ga

You can order the one meg machine and a fourteen meg ram board to get that unit, Mike. We will have upgrade boards for four megs of ram, and fourteen megs of ram. :) Then of course, you could order the HD kit with the 200 meg HD!

Next is John.

<[John] JKUEHN> Eric, What is the reason that MiNT Ver 0.95 and the ICDXX.XFS combination only reads Kodak ISO9660 Photo-CD disks? Bob, ICD says that they are currently waiting for a fix from Atari for a problem with Metados 2.0. Comments? GA.

<[Eric Smith] ST-GUEST> I haven't seen the ICD .XFS file system, so I don't know why it only reads Kodak disks. Probably it's based on an older version of the .XFS driver (which was developed originally by the same developer doing Photo CD, so he obviously had a certain focus :-). Also, MiNT 0.95 is very old; the version going into MultiTOS is 1.04. GA

John, don't know...better check with Bill Rehbock on that one. ga

Next is Sean from TWS

<[Sean@TWS] S.DOUGHERTY1> How much will the monitor adaptors cost (estimate okay), and do you need both for a multisync monitor? Could you say if Alan Skaggs of A-Online Computing in Tampa, FL is a real dealer? GA Sean, the monitor adapter go for about $15 if memory serves me correctly. For a MultiSynch monitor, you'll just need to VGA. A-Online in Florida does have an account with us, mostly he just buys parts, and does service. I don't believe that he sells new product, but I'm not 100% sure about that one.ga

<[Sean@TWS] S.DOUGHERTY1> Can you get the TV/ST resolutions on a MultiSync using the VGA adaptor? ga

I think that it depends on the monitor, not the connection...

Now Brian again.

Hi again. What does/can ATARI offer to user groups to promote the ATARI line of computers? I believe user groups are the the most economical form of advertising for ATARI. Do you have press kits, information packages, etc.? What about lending of equipement for mall presentations, etc. I am amazed at the number

of members in the user group I am in, considering there is no dealer within 20 hours of driving. GA?

Brian, in the past we have offered user groups a tremendous amount of support in the form of free equipment on loan for their shows, like mall presentations, etc. We have not, as a rule, sent out Press kits to user groups, because the material that we send to the public vs. the press vs. the dealers is all different. For example, in Milwaukee every summer, we loan about 50+ systems to a user group for use at a huge gaming convention, and they also manage to make a little bit of money off of it. I feel that in the next year, we'll be more inclined to do those things in conjunction with a DEALER as well as a user group. Often, we're much better off working through the dealer than just the user group. The user group is always very enthusiastic about the product, but not always as sales oriented as we'd like. For example, in Las Vegas this past COMDEX, we had (as we always do) a great group of guys from the Las Vegas groups helping us out with the Falcon030 set up, etc. But they were really having a great time checking out the machines for *themselves* as well, if you know what I mean. :) ga

I agree Bob
a dealer would be best. But in our case A show or proper presentation may attract a dealer. Thanks for the answers, I really appreciate them. GA

Thank you Mike for backing me up tonight. Bob and Eric, it's been a long night, full of terrific information. I look forward to preparing tonight's transcript and reading what I missed Thanks again Eric. See you in April, Bob!

Closing comments, Bob, Eric?

<[Eric Smith] ST-GUEST> You're very welcome.

Thanks again for a wonderful evening on GEnie. I hope that it was as much fun for all of you as we had. This time we had a total of four people online in my office for most of the night, and had a terrific time! I'm looking forward to next month's CO already! Thanks again, and goodnight!

3782. Re: Does anyone use Ultrascript??

Newsgroup: comp.sys.atari.st
Date: 1993-03-08 17:09:35 UTC
From: bjgrier@bnr.ca
Message-ID: <C3KyBz.7G9@news.rich.bnr.ca>
Source record: 209133

I have heard of problems with Ultra-script on a TT, though from what you've described you are not even getting that far. Ultra-script is supposed to work with many printers via the parallel port. Try changing from the parallel port to the DMA port. The only printer that could be on the DMA port is an Atari laser printer.

There was a 24 bit address program that fixed most GFA Basic programs, and just happened to work with Ultra-Script, if I am remembering this correctly.

Cross-posted to: comp.periphs.printers,comp.sys.atari.st

Hi, Could anyone point me in the direction of Printer Drivers for
the Canon Bubble Jet (BJ10ex) printers for the Atari ST.
These are mainly wanted for Degas,1st word plus and Calamus. I've
found plenty for the Hewlett Packard Ink Jets, but none for the BJ.

Thanks,
Adam whitham.

3784. MIST AtariFest V

Newsgroup: comp.sys.atari.st
Date: 1993-03-08 18:05:12 UTC
From: Bill.Jones@f370.n231.z1.fidonet.org
Message-ID: <731646016.AA01088@royaljok.fidonet.org>
Source record: 209150

The Mid-Indiana Atari ST Users proudly announce our fifth annual AtariFest will be held on Saturday, July 31st, 1993 from 10:00 am until 5:00 pm! MIST AtariFest V will continue the tradition of being one of the best "one day" shows in the nation at our new location in the Best Western Waterfront Plaza Hotel!

MIST AtariFest V will be held at the conveniently located Best Western Waterfront Plaza Hotel just minutes from Indianapolis International Airport. Our new meeting facility is nearly twice the size of our former location and also boasts a 150-seat auditorium. Best Western Waterfront Plaza Hotel is situated close to several major highways and near several eateries and entertainment centers. Best Western Waterfront Plaza Hotel provides complimentary transportation to and from Indianapolis International Airport.

MIST AtariFest V will be conducted with our proven method of success and will provide enjoyment for all the guests that attend.

MIST AtariFest V caters to not only the novice but also to the professional users. Guests are invited to attend any or all of several seminars which will be held throughout the day. "MIST User Group" memberships will be offered at a one-time special price to all guests. Open invitations are extended for Lynx and MIDIMaze competition tournaments. The top players will receive prizes. A spectacular assortment of limited edition T-shirts will be available for purchase throughout the day. Raffle prizes of all shapes, sizes and purpose will be awarded during the festivities.

Best Western Waterfront Plaza Hotel is offering special discount rates to guests of MIST AtariFest V. Guest rates start at $53 for a single and $59 for a double room. Special facilities will be provided for the handicapped, non-smoker and guests with small children. Please contact the Best Western Waterfront Plaza Hotel at (317) 299-8400 and be sure to mention MIST AtariFest V to get the special discount rates.

Admission to this proven event is still only $3.00. Dealers may purchase booth space in advance for $50.00 per table. User Groups may obtain tables at $10.00 each.

For more information, please contact me through one of the following methods:

Phone: (317) 856-4260
GEnie: W.JONES43
FidoNet Mail: Bill Jones at 1:231/370.0 (The Zoo BBS - (317)

Okay, this may not be a wide appeal type request, but...I was wondering if anyone knows of a CURLING game available for the ST? I have seen a couple of PC curling games and I have a passing interest in the sport! So, if anyone is aware of an ST port of any curling games I would appreciate the info :^) Thanks muchly in advance,

T.T.F.N.
JR.

3787. OCTAMED/ProTracker for STE, yesno?

Newsgroup: comp.sys.atari.st
Date: 1993-03-08 19:27:34 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Mar8.192734.4307@dct.ac.uk>
Source record: 209115

Hey! Does anyone know if any group out there has done a music editor (by that I ofcourse refer to tracker style 4channel jobs) that is like (perhaps even a conversion of) the Amobea Pro-Tracker or Octa-MED music eds?

I really would like to get hold of a decent tracker ed that allows me to use my midi keyboard along with them! I've tried all the trackers for STE, but haven't really liked any of them, the best I think was Audio Sculpture, but that was bug ridden (at least as soon as you plug in a midi keyboard!)
I can't afford progs like Quartet - which I hear is dead good - so I was wondering if anyone's done anything on the PD or shareware scene?
Don't say TCB Tracker, as its a very slow editor in conjunction with Midi!
The version I have of Audio Sculpture is an old one, though I was told by one of the members of Synchron Assembly (the group that created it) that v1.4 is the latest and that I should try and get hold of that. Unfortunately when I mailed him back asking where I could get hold of a copy, I got no reply.

So if anyone can help with any of the above queries, I would be dead grateful!

Cheers,

The ever troubled STE owner,

Feekzoid

3788. .ANI Runner anyone?!?!

Newsgroup: comp.sys.atari.st
Date: 1993-03-08 20:04:20 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Mar8.200420.4308@dct.ac.uk>
Source record: 209120

Okay, its feekzoid here, the one with all the nasty atari problems!!

Right! This time:

In reply to my query about an animator for full screen 16 or more colour screens, I was told that I should (amongst others) get Deluxe paint ST.

Great! I will. (as soon as I get the money!)

But until then, I would like to run other peoples animations, so I would like to know if anyone know of a .ANI player? This is ofcourse the Deluxe paint animation format, which is apparently compatible the amiga one.

Does anyone know if a player/runner exists? If so could they tell me where to get it or mail it to me if it's PD or shareware?

Please !!! 'Coz it'll be a while before I can afford to purchase the full package. (typical student type excuses I know!)

Thanks yet again, all you nice Atarians!!!!!

Said the Feekzoid.

3789. Re: 680x0 computer comparisions

Newsgroup: comp.sys.atari.st

In article <1993Mar5.121241.14609@umiami.ir.miami.edu> dlk0ms9s@umiami.ir.miami.edu writes:
> Here is a technical comparison between Atari's new Falcon 030,
> Commodore's new Amiga 1200 and Apple's new Performa 400.

Well, this summary isn't too bad overall, but there are some major blunders for the Mac machine (God I hate those new Apple names, "Performa x00", Centris, etc blechh).

> Atari Falcon CBM Amiga 1200 Apple Performa 400
> data path(bit) 32(16used) 32 32

If the "Performa 400" means LC2 in English, it has a 16-bit path to memory, just like the Falcon. (Probably where Atari got the idea).

> FPU optional optional optional
> socket on board yes no no

As far as I know, the LC2 does have a socket for an FPU.

> OPERATING SYSTEM
> type multitasking gui multitasking gui multitasking gui

The author is obviously not up on the Mac system... the Falcon and 1200 have true pre-emptive multitasking, but the Mac System 7 does not... they call it "cooperative multitasking", i.e. processes must voluntarily surrender the CPU, which isn't nearly the same thing.

Also using the LC2 as a comparison and calling it a "new machine" is also way off... the LC3 should have been used, since it's in the same price range now. The LC3 would come out considerably better in the comparison than the LC2...

This depends on which version of GCC is being talked about, surely? If
1.40, the above is baloney, it will work fine in 4meg + hard disk.

The original poster should give more details as to which version of GCC
is involved? Then someone can give more specific help I'm sure.

The Falcon supports all up to 640x480x32767 though the system through put
is reduced over the 640x480x256 mode.

I'll agree with everything Dave Baggett said in his reply.

> I agree with some stuff here, but implying that an LCIII is better
>than a Falcon... no, ah ah, sorry (at least in hardware terms).

Hmmm. The LC III might lack a graphics coprocessor, but it does have separeate video memory. One also hopes that more Falcon programs really use the Blitter than STE programs did. The faster processor in the LC III with 32-bit memory will also make a big difference in user purchieved speed (but then Sys 7 can take alot of that away...).

The scsi II is a real boost. Whats the maximum bandwidth on Falcon scsi II (not on scsi II but on a real Falcon). Some real numbers would be nice. I think the Falcons strengths are sound (but of course!) and it's i/o speed. Of course it matches up against the plethora/easy-to-find Mac software Market.

Of course the sound sub-system on the Falcon looks really easy to program, so I would think that software (normal user, not music) software would come out soon to really tap some of it's power.

I recently got issue 43, January 1993 of ST Format. I see it has a
STOS upgrade program for programs that are already compiled. It
says in one of the articles that on cover disk 42 from the
December issue has the update for the language disk itself.

If anybody has this program I urge you to post it to Comp.binaries.atari.st!
Or better yet, put it on archive.umich.edu.

Thanks.

>
>So the question arises if there is some escape build in, in the host adaptor,
>to put the "real" scsi command number somewhere else (in a next byte?).

This is my understanding. i think the answer is no. i am helping to write
some tape software, it would be nice if this wern't so, but i am afraid it is.
For SCSI-I devices this is not a big problem (sequential devices that is).

i would love this to be wrong. Let me know if you find out different.
i don't see what the escape could be. All combinations of the first byte
are valid SCSI IDs+command codes. i don't doubt it would be possible to build
a host adaptor that interpreted things differently. That is a hardware solution
though, and you (we) want a software one.

Hi,
A while back, someone put up ports of most of the pbmplus utilities
on an anonymous ftp site and posted a note here. Unfortunately, I've lost
the name of the site, and haven't been able to find it, and archie's been
no help.
Could whoever put them up please mail or post the name of the site with
the utilities? Note that I'm _not_ talking about the very old, limited port
of the pbmplus utilities that exists on atari.archive, or copies of it.
Thanks for any info.

So are you an official 3DO developer or a wannabe? Did 3DO tell you
they used realtime JPEG decompression or is that an assumption?
Developers who apparently have had experience with both systems
seem to be more impressed with the Jaguar. Does that affect you
in some way?

> (You can do a 30-minute movie in better-than-TV resolution, for example.)

I'd rather watch a full-length movie from a laserdisc thank you.

> The 3DO comes with a CD ROM drive. It has software and hardware meant

> (particularly since they face a veritable armada in the 3DO
> consortium), but who knows. (For the record, I do think that console
> units are Atari's last hope before they fade away into complete
> oblivion.)
>

If you are familiar with recent history you know that the execs
(Jack Tramiel et al) at Atari were the founders and execs at
Commodore. The Tramiels battered Atari's superior 800 computer
with their C64 and took Commodore to over a billion dollars in
sales in the early-mid 80s. What have *you* done?

They were also instrumental in defeating the MSX "armada"
formed by Microsoft and many large Japanese companies with
their C64 and later with their ST systems. So for the record,
Atari has been infinitely more beneficial to millions of users
than you have in all your net pontifications. Maybe one day
you will take the risks and responsibilites and demonstrate
your competence in a cutthroat consumer electronics market.

> The one thing Atari has never had a lack of, despite their pattern of
> embarrasing incompetence and failure, is arrogance. This is just like
> the bluster we heard about the Falcon. In fact, John Skrutch and Bill
> Rehbock gave me *exactly* that line ("The Falcon could/will be the machine
> that 'turns things around' for Atari") in July. Deja vu!

You mean failure like how NEC is doing in the electronic games
business relative to their size? Or maybe arrogance of how Apple
ditched their Apple II and III and Lisa market for the Mac and how
the Mac market will be screwed by the Power PC? Maybe you mean
incompetence on the scale of IBM as demonstrated by their recent
losses. I won't bother to go on about NeXT.

I guess you just mean Atari is just like the original Amiga and
Epyx companies that now lie in oblivion?? Many of their principals
are now at 3DO I understand. Now *THAT* is deja vu all over again.

3797. GUIs another call for feedback

Newsgroup: comp.sys.atari.st
Date: 1993-03-08 23:46:05 UTC

Cross-posted to: comp.windows.open-look,comp.windows.ms,comp.sys.mac,comp.sys.atari.st

Yes its me again asking your opinions on yet another are of GUIs and
their users, this time there are two questions, the first of which has come from
experimental data and the second of which has come from conversations and mail
about the area of GUIs.

Firstly: I have noticed that novice and intermittent users often forget that
they have a window running that is hidden by the other windows on the display
this often leads to problems (in once case it cause a user to lose work by having
two editors on the same file and saving on the hidden window when it became visable)
I am thinking of recommeding in my report that the default for a user interface
should be that some part of all windows must be visable, and that this can be over-
ridden by experienced users who tend not to have problems with this.

Secondly: There appears to be three classes of user for GUIs, the icon based, the
menu based and those who prefer to have short-cut keys. In which area do you feel
you fall ? And for what reasons ?

So in summary the request for data this time is for

Whether you feel systems should default to a position so no window can be completely
hidden.

And whether you consider yourself to be an icon,menu or key-based user and why.

My email address (it has changed since last time) is

>I'd be curious to hear how this works out.

Well Chris, it works great, and has worked great for more than a couple
years now. You can compile most unix-type stuff off comp.sources.unix with
only 2 MB of RAM, though having 4MB makes it nicer because you can leave
temp files in a RAMdisk. If you're running under MiNT you can forego the
temp files completely, and just run all the passes in a pipeline.

Sure, an 8 MHz 68000 is no speed demon, but GCC is still surprisingly fast
compared to other ST compilers like MWC, Alcyon, etc... (From what I hear,
it still doesn't come close to Turbo C or Pure C for compile time, but GCC
still produces better optimized code than all the other compilers around.)

You will sometimes run across programs that can't be compiled in 2 MB of
RAM, these tend to be cases where the author chose to write everything in
a single source file instead of splitting functions into separate files.

As for gobbling up resources on a virtual-memory unix system - I would guess
that you've been using SPARCs or other RISC-based workstations too long, and
have forgotten one of the fundamental differences between RISC and CISC - the
compiler *must* do enormous amounts of extra work on a RISC machine in order
to achieve reasonable performance. GCC for the SPARC has a couple of extra
internal passes to run thru compared to GCC for the m68k, and has to keep
track of a lot more state on a RISC machine. Yes, GCC is incredibly resource
hungry, but it is feasible to run it on a lowly little ST. The resource
requirements you quote are characteristic of the tradeoff in going to RISC -
more instructions are required, thus more memory is consumed.

I thought I read recently that the original ICD Host Adaptor will not work correctly with a MEGA STe. I will be getting a MSTe with TOS 2.05 (or is it 2.06, I don't remember) to replace an old 1040ST with TOS 1.0.

I looked inside my HD case at the host adaptor and it was stamped: "ICD ST HOST ADAPTOR BD" across the bottom. I did not see a date anywhere on the board.

Will this be a problem? Has anyone ever experienced this problem? Does anyone have the stated hardware and never experienced a problem?

Thanks,

Troy Carpenter

Actually, it really does depend on the adaptor. If you plug in a VGA adaptor, the Falcon will use VGA sync rates. If you plug in the ST adapter, you'll get composite sync rates (or ST mono sync, if you then plug in a SM124, etc.). To get TV resolutions on a multisync monitor, you'll need the ST adaptor and then an ST to multisync adaptor, or you'll need to modify your VGA adaptor. I think this would be a good way to make a quick $15/item, sell a Falcon video adaptor with a toggle switch on it to select VGA or ST mode, for use with multisync monitors. (The switch would obviously be of little use if you have only an ST monitor or a regular (fixed-frequency) VGA monitor...)

3807. Turbo-Link

Newsgroup: comp.sys.atari.st
Date: 1993-03-09 04:25:12 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1nh678INNsh5@golem.wcc.govt.nz>
Source record: 209142
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.8bit

I have just managed to get my hands on 'Turbo-Link XL/XE' But the software version is only 0.96. (Mostly German). Running the ST to XL conversion selction, results in an 'available in version 1.0 message.

Does anyone out there have, or can tell me where to get, a version of the software more recent than 0.96 (It was written in 1990, so it's not all that old!)

By,

M. Reitershan Computertechnik
D-5429 Meihlen/Taunus

Any help would be great, as it means I can *finally* get my print-shop libraries (all 8 disks of them) into Print-Master + format! (With a bit of work). Not to mention the loads of other goodies I can exchange back & forth!

E-Mail replies would be best, no point wasting bandwidth.

3808. Re: Jaguar vs. the 3DO (was Re: Atari Jaguar)

In article <1993Mar8.230341.21952@actrix.gen.nz> James.Hamilton@bbs.actrix.gen.nz writes:
>So are you an official 3DO developer or a wannabe?

Some people here at the lab have gotten information regarding the 3DO,
and will be developing games for it. That's where the info I cited
comes from. So I am neither a wannabe nor a developer myself.

>Did 3DO tell you they used realtime JPEG decompression or is that an
>assumption?

They explicitly metion JPEG. They explicitly state that you can expect
to get 30 min. of real-time video from the disk. (For a demo, of course.)
They mention 650M of data per disk.

>Developers who apparently have had experience with both systems
>seem to be more impressed with the Jaguar. Does that affect you
>in some way?

No one that I know of has had *any* experience with the Jaguar. It is
right now a mythical machine. (As far as I know. Give me the name of
someone who has worked with one outside of Atari and I will gladly
retract this statement.)

>> (You can do a 30-minute movie in better-than-TV resolution, for example.)
>
>I'd rather watch a full-length movie from a laserdisc thank you.

Your post seems extremely defensive. Note that I have nothing against
the Jaguar or Atari; I am just stating some obvious facts about the
situation w.r.t Atari's Jaguar competing against the 3DO, on the basis
of the very real information that the 3DO consortium has sent some of
my peers here. If the Jaguar beats the 3DO, I will be happy. If the
3DO beats the Jaguar, I will be happy. I do not plan to develop for
either in the near future. Nevertheless, I think I know enough about
video games and interactive media to make a judgement about what Atari
will have to deal with to compete with the already existing 3DO. Hence
my cautionary post about the Jaguar (and 3DO).

As for your previous comment, the point is not that you'd like to
watch a movie on your 3DO, but that you could have fully detailed
better-than-TV quality animation sequences in the backgrounds and/or
title pages of your games. For that matter, your sprites could be
digitized and, given the 24-bit video, could look very "real." Atari's
Jaguar must offer similar capabilities (or siginificantly beat the
price of the 3DO, and *soon*) or they will lose to the 3DO. You're
talking about one of the most competitive and rapidly changing markets

in the world here. (Game consoles, that is.) It's a rough business.

>So what hands-on experience have you had with the 3DO?

None, personally, but this is all hypothetical anyway. Looking at the specs of the 3DO, and its advertised capabilities (in info to developers), I can tell you that Atari has a difficult situation ahead of them. The Jaguar better be better than the rumored specs for it to compete. (Or, again, much cheaper.)

>> Another plus for CD-ROM based systems which is unknown to most game
>> players is that CD's are far cheaper to produce than cartridges. If
>> the Jaguar is a cartridge machine, people won't develop for it instead
>> of the 3DO. (Carts cost $10 to $20 while CD's cost $1 each.)
>
>So you don't know if the Jaguar will offer options or come in several
>models? What exactly do you know about both systems?

Read what I wrote. I *know* that the 3DO will be a CD machine. There has been no public statement about what the Jaguar will take. All I have said here is that the Jaguar better take CD's or it will lose. This is just my opinion, based on the facts about CD storage and general 3DO information (which, unless the consortium is commiting political suicide, can be taken as fact, since it has been released to developers).

>> Add to all this the fact that the 3DO developer's kit is said to come
>> with 100+ CD's of video clip art (aka stock footage)that you are free
>> to use in your games. (I.e., they've already gotten permission for
>> this.)
>
>So 3DO users will pay to see identical clips ad nauseum?

Look, you can love Atari all you want, but face facts. If they don't produce a competitive machine, you can whine about their failure until you're blue in the face, but they still end up losing. The 3DO CD database is a perk. It's very useful for gettting good games running quickly. You don't have to use the whole scene in your game. For example, you may take just the picture of the cheetah leaping in the Mutual of Omaha's "Wild Kingdom" clip. You could then use that digitized sprite in a game where you fight a cheetah in one round. Just a hypothetical example, but the *potential* value of such a library is clearly immense.

If Atari has a similar or less capable system for about the same price, and they don't have the perks like real-time JPEG decompression and the library of stock footage, developers will like the 3DO better. Hence, better software base for the 3DO.

Game companies like Microprose decide to develop for machines on one basis, and one basis alone: money. They will develope for a machine only if they feel that they will get a good return on their investement (in this case, the money it costs to put several full-time programmers

to work learning the machine and porting a first game). It's not just a matter of which has better hardware. So the "perks" matter.

>The Tramiels battered Atari's superior 800 computer
>with their C64 and took Commodore to over a billion dollars in
>sales in the early-mid 80s. What have *you* done?

First of all, the Tramiels have only shown that they can do well in the mid-80's home computer market. The market has changed and they are no longer doing well. (Check stock prices, for example.)

Second, I've done plenty of interesting things in my (short) life so far, and I have no reason to gauge my success to date (in terms of # dollars made, # of machines sold, # of Usenet posts writte, etc.) against someone who is three times my age. Neither do you.

This is a capitalist market. The most attractive machine to consumers and developers will win in the long run. The fact that EA and Panasonic are already behind the 3DO is a strike against Atari (a company which is now viewed as a complete joke by the rest of the industry. This makes them a "risk."). Atari has to overcome a lot to win here. They could do it, yes, but to do so they will have to pass many hurdles, some of which I delineated in my previous message.

Let's just make it clear here, before I get made into the bad guy of c.s.a.st again, that *I* did not start this impending flame war. It seems that every time I question Atari's future in some less-than-rosy scenario, people jump on my case. Take the jingoistic attitude to email -- but if you want reasonable discussion, I'm all for it.

For the record: I DO NOT CARE if the Jaguar does well or not. I am simply making what I think are sound observations about the state of the market and what Atari and the Jaguar must do to succeed.

>They were also instrumental in defeating the MSX "armada"
>formed by Microsoft and many large Japanese companies with
>their C64 and later with their ST systems.

ST systems? You're kidding, right? Would you actually consider the ST a success? Why is Atari now in the "less than 1% market share" slice of the pie? And, speaking of Japan, the biggest selling non-Japanees machines in Japan are now Macintoshes. (No wonder since they're the only machines short of Sparcs that handle Japanese word processing well.)

>So for the record, Atari has been infinitely more beneficial to
>millions of users than you have in all your net pontifications. Maybe
>one day you will take the risks and responsibilites and demonstrate
>your competence in a cutthroat consumer electronics market.

Get this CRAP off the newsgroup. Email me spewage like this so no one else has to read it. I have contributed a lot to this community, all for exactly ZERO in return, and none of your flamage will change it.

So lose your attitude. I don't have to put my academic life on hold to prove a point to *you* just so I can post something in this newsgroup.

Some day I may very well do what you challenge me to do. But for now I think I'd rather take the MIT up on their offer of a Ph.D. program in Computer Science. If it's OK with you, of course.

>You mean failure like how NEC is doing in the electronic games
>business relative to their size?

Yes, failure like that.

>Or maybe arrogance of how Apple ditched their Apple II and III and
>Lisa market for the Mac and how the Mac market will be screwed by the
>Power PC?

Yes, arrogance on par with Apple's. (We'll see about the Power PC; I won't speculate on that.)

>Maybe you mean incompetence on the scale of IBM as demonstrated by
>their recent losses.

Yes, just like that kind of incompetence.

>I won't bother to go on about NeXT.

Good examples! Atari's performance in the past 5 years encompasses all the things you described. Since being bought by Warner, they have reduced their 95+% market share in the home console market to almost zero! No wonder they study Atari's "fall from grace" in B-school now -- you have to WORK to lose that badly.

Atari could still turn it around. But they have a tough row to hoe.

>I guess you just mean Atari is just like the original Amiga and
>Epyx companies that now lie in oblivion??

Epyx, FYI, provided Atari with their only current makret share in the home console market: the Lynx. Of course, the Lynx development system runs, at Atari HQ in Sunnyvale, on ... <snicker> ... Amigas. And John Skrutch says they just couldn't LIVE without their favorite Amiga editor, which is why they have resisted upper management's demands that they convert the development system to the TT.

>Many of their principals are now at 3DO I understand.

The 3DO is Trip Hawkins' vision. If you want to talk about success in the video game industry, look to EA. Look to Trip Hawkins.

Hi

I'm researching human-computer interfaces and I was wondering
if anyone has ANY useful information on voice-recognition?

Is there any info on fancy voice-recognition / synthesis hardware for the
ST/TT/Falcon?

If so, please e-mail it to me.

3811. NEW Unnkulian Unventures! Commerical Quality Text Adventures for FTP

Newsgroup: comp.sys.atari.st
Date: 1993-03-09 08:27:05 UTC
From: dmb@case.ai.mit.edu
Message-ID: <1nhkcpINN4mu@life.ai.mit.edu>
Source record: 209145
Cross-posted to: rec.games.int-fiction,rec.games.misc,comp.sys.mac.games,comp.sys.ibm.pc.games,comp.sys.atari.st,rec.games.programmer,rec.arts.int-fiction

*** THE BIG NEWS THIS TIME:

ADVENTIONS announces the release of their new games, "Unnkulia One-Half: The Salesman Triumphant," and "Unnkulia Zero: The Search for Amanda". To find out more about them, read on. Or, if you're *really* impatient, forget the rest of this note and grab the exciting new wares pronto from ftp.gmd.de:

PC (MS-DOS) version:

ftp.gmd.de: if-archive/games/adventions/unnkhz10.zip

Others:

ftp.gmd.de: if-archive/games/adventions/unnkhz10.tar.Z

Note that for the "others" you will need the TADS 2 run-time for your machine. (Look for these on the same site in if-archive/programming/tads.) The .tar.Z file must be extracted with the tar and compress programs, which run on most Unix machines:

```
uncompress unnkhz10.tar.Z
tar xvf unnkhz10.tar
```

The resulting .gam files will run on any machine that runs TADS 2. (Be sure to transfer files in binary mode!)

Mac users will have to set the file owner and type of the .GAM files to TADR and TADG to get the TADS run-time to recognize them. This is temporary; we will post special Mac versions to ftp.gmd.de within in a few days.

Unix ports of TADS 2 are in the works and should be ready very soon. (Specifically, we have it running on a Sparc, but it still needs a bit of tuning. Ports to other Unix boxes should be straightforward, and can hence be expected soon.)

An Amiga port is also in the queue.

--

The Unnkulian Unventure Series
Interactive Fiction for the 90's

Remember the good old days, when adventure games challenged you with great puzzles and evocative descriptions without resorting to any graphics at all? We really miss that emphasis on gameplay rather than

glitz, so we've decided to write our own adventure games along the lines of the early text games we liked so much.

If you're looking for top-quality interactive fiction comparable to 1980's commercial offerings, check out the Unnkulian Unventure series, available from an archive site near you!

In _Unnkulian Underworld: The Unknown Unventure_ you play the part of Kuulest's slave, and must recover the Orb of Studosity from the evil Unnkulians. Kuulest, the old geezebag, has died and left you with nothing to go on but a cryptic message about saving the planet. You'll encounter amazing Acme products, the infamous Guardian, those witty creatures known as Drolls, a giant beaver, and even the Dread Unnkulian Warrior. <Gasp!>

In _Unnkulian Unventure II: The Secret of Acme_ your adventure continues as you try to create some good press for yourself -- wouldn't want to fade into anonymous obscurity, now would you? Along the way, you'll find the answers to these compelling questions, and more:

o What happened to the Unnkulians?
o Why are Acme products so bad?
o What is this cheez stuff, really?

Plus, you'll get to explore Dawg Rock, a Duhdist Retreat, Acme's clandestine prototypes laboratory, and even pay a visit to Acme HQ.

In _Unnkulia One-Half: The Salesman Triumphant_, you'll play the role of a down-and-out Acme salesman, forced to work out of the Golden Dragon Inn, dangerously near Dread Unnkulia. Will you accumulate enough loot in this frightful backwater berg to turn your fortunes in your favor?

And, in _Unnkulia Zero: The Search for Amanda_, will you, the Valley King's most trusted warrior, rescue his Lady Amanda from the gruesome clutches of the evil Unnkulians?

Along the way to victory (or, <shudder>, defeat!), you will:

o Find out about the ancient days of the Valley,

o Meet the King's faithful (but not so bright) Valley Patrol,

o Explore *beautiful* Lake Draounheer,

o Discover the ancient burial ground of your ancestors,

o Become frustrated with the pesky Stoll and his Stoll Bridge,

and, of course,

o Meet that wondrously wacky Wowsa Willy!

The Unnkulian Unventures have already gotten rave reviews from numerous adventure game connoisseurs around the world, so why not give them a try?

The games are available for FTP from ftp.gmd.de:

PC and compatibles:
---

if-archive/games/adventions/pc/unnk1v30.zip
if-archive/games/adventions/pc/unnk2v30.zip
if-archive/games/adventions/pc/unnkhz10.zip

Mac:
---

if-archive/games/adventions/mac/unnk1v30.sit.hqx
if-archive/games/adventions/mac/unnk2v30.sit.hqx
[Special Mac versions of One-Half and Zero coming soon!]

Atari ST/TT/Falcon:
---

if-archive/games/adventions/others/uu1v20.tar.Z
if-archive/games/adventions/others/uu2v30.tar.Z
if-archive/games/adventions/others/unnkhz10.tar.Z

Amiga and Unix:

Don't worry, we fully intend to support these machines!
Unix versions should be available very soon. Amiga versions
are in the works.

Unnkulian Unventures I and II are shareware ($10 registration fee
each); registering gets you spiffy maps and agony-sparing hint sheets.

Unnkulia One-Half is free -- don't pay us for it! Consider it our
gift to you -- guilt-free!

Unnkulia Zero is US$25 and is available via mail order from ADVENTIONS
or via phone (credit card order) through High Energy Software.
Unnkulia One-Half comes with a playable demo of Unnkulia Zero, which
includes information on how to order the complete version.

Happy adventioning!

Dave Baggett
ADVENTIONS

Internet: dmb@ai.mit.edu
Compuserve: 76440,2671
GEnie: ADVENTIONS

A Word About TADS

We at ADVENTIONS use a programming language called TADS to write our
games. TADS is a product of High Energy Software, and you can get it
via FTP.

TADS (and TADS goodies) are available for the PC, Mac, and Atari ST,
from ftp.gmd.de. Look in the if-archive/programming/tads directory.

TADS is also shareware, and we strongly encourage you to register it if
you use it, since we feel it is a powerful, innovative, and very
inexpensive development system that deserves to be paid for.

I'm afraid a 5.25" simply wouldn't fit inside the case. A small 3.5"
HH just MIGHT fit with a bit of twiddling, but you probably have to
get a 2.5" drive, which are getting cheaper because of the increasing
popularity of laptops.

3814. TeX fonts/Calamus

Newsgroup: comp.sys.atari.st
Date: 1993-03-09 12:54:59 UTC
From: strgh@csv.warwick.ac.uk
Message-ID: <1ni433INN1rg@violet.csv.warwick.ac.uk>
Source record: 209053

I'm looking for a nicer main TeX typeface than cmr, which can IMHO
look {\rm GHASTLY}. I'm mainly using CSTeX and a DeskJet-500.

I found a file meta_con.zoo at atari.archive (really src.doc.ic.ac.uk),
which claims to `Convert Calamus/vector fonts for use with metafont'.
However, when I try to extract, I just get a `Segmentation font'.

So, does anyone know of a working version of such a program,
and is it worth using? (I envisage using it on, e.g., the font
times.zoo from atari.archive).

Alternatively, are there any other suggestions for a cmr-substitute?
Ideally, I want metafont source. I've had no luck on the comp.fonts
or TeX newsgroups.

>Anything that tries to access the sound chip (ie, everything) dies a
>horrible death.
From the bit of chitchat I had, it seems that indeed revision 3
motherboard falcons did have problems with programs that used the st
soundchip. I have no idea why, because the sound chip is there. But,
from what I have heard form some falcon owners the newest revision 4
Falcons do no longer have problems with the soundchip (the ST one that
is.)

>But, even games that worked on the TT, which is less ST-compatible than
>the Falcon is supposed to be, don't work, like Llamatron.
Again the newest Falcon will run them. And that is the Falcon you can
buy in the shops from this month. The earlier machines have all sold
out, so there should not be any worries.

>No... Atari probably won't release an '040 machine this century... :-(
What about announcing the thing in 2 weeks at Cebit in Hannover? New
Atari machines are usually announced at Cebit.

[worthless stuff deleted]

Look Dave, the point was that developers who know something about BOTH systems (unlike yourself who seems to know something about one of the systems) have been more impressed by the Jaguar. Look in the march issue of EGM (Electronic Gaming Monthly) if you want it from the original source of the info.

P.S. I think people would rather play a real video game than the kind where you stop playing and watch a little bit of video which will be the same every time (in other words the ability is not that important).

P.P.S. What is meant by 'Commercial Quality TEXT Adventure'? Isn't that some kind of oxymoron? ;-) Where is the full-motion video?

Thanks.

I have found a problem with photocrome version 3. The scaling routines do not seem to work correctly. Sometimes when viewing pictures the picture gets reduced to 320 x 200 but there are vertical black lines in the picture. Other times it looks as if the program has shifted every sucessive line to the right resulting in a garbled picture.

Well, watch out by what Gaming magazines say... I agree with Dave,
if the Jaguar is a 'Falcon' in graphics, I see it having a real hardtime
beating 3DO (unless it's priced much lower). But again, I know
nothing about the Jaguar, something about 3DO, and a lot about ATARI.

Now, can anyone post here what they said in the magazine? What
are the Jaguar specs?

|> incompetence on the scale of IBM as demonstrated by their recent
|> losses. I won't bother to go on about NeXT.

Well, I think ATARI is encompassing all of that plus more. The Tramiels
have been very stubborn when some people have pointed out potential

solutions for them. Right now where is ATARI? I had an ATARI 600xl, then an ATARI 130XE, and later an A500 and now an A1200. Why I jumped ship? Atari's record of lack of professionalism and lack of competitiveness. They were competitive, before.

C=' has improved their OS big time, and has more support than Atari right now. Why? The ST was supposed to be the next C64.

Simple: Amiga prices went down, and Amiga technology was superior to the ST.

Now we see the Falcon, which looks nice I admit... let's see how Atari manages. C='s presence in the US is being critiziced now as almost none, Atari's presence in the US is practically zero.

Another trivia hint: Tramiel was fired from C=. Why? He was doing a lot of bad things. I remember the very bad quality control C= had with the C64 before.

So: A lot of companies may have lost a lot of things, but Atari has been exceptional. Atari has the record for the fastest (or second fastest) growing company and went to having a record for one of the fastest declines.

|>
|> I guess you just mean Atari is just like the original Amiga and
|> Epyx companies that now lie in oblivion?? Many of their principals
|> are now at 3DO I understand. Now *THAT* is deja vu all over again.

3DO will kick serious ass. Even when I would have loved CDTV to become the standard 3DO blows it away by a factor of 3x10e110!

Warning: do not use the program Hypercopy. Although some people claim it is excellent. It contains lots and lots of mistakes. When I runned the program, it worked so so. It gives some errors on perfect disks and so, but the worst thing is that after you run it you will have to reset the computer, because it completely messes up the system.
When I checked the program with a debugger, it turns out that it even uses some illegal op-codes. So it is not recommende that anyone use this program.
Also, the dialog boxes are awful. They use grayish background, which makes the black characters blurred.

Erlend.

Someone did post what the magazine said. That is what started this thread! All it said was that 3 different sources (presumably 3rd party developers) all confirmed that they were more impressed by the Jaguar than the 3DO (not in those exact words but their words were even more extravagent). Note that these sources seem to know at least something about BOTH systems.

OK, I GIVE UP !!!

I've been trying to format/partition my hard drive (an atari SH204).

It's second hand, and the original formatting utilities (dated 1986) are
corrupted. I got a hold of the latest distribution of AHDI, but when I try
and format, I get a DRIVE NOT RECOGNISED error message.

I tried swapping the data file that came from the OLD distribution with the
NEW one, to see if the NEW utility would recognise the HD then.

NOPE.

I tried to partition the HD without formatting first, but I got the error:

DRIVE FORMATTED WITH OLD VERSION OF HDX, REFORMAT BEFORE PARTITIONING

Blimmin' great !!

Can anyone send me a copy of the 1986 distribution of HDX that WORKS ??

Can anyone (ie at ATARI) tell me how I can make an ATARI HARD DRIVE compatible
with an ATARI ST ?? (the program told me to contact ATARI !!)

Dave.

I'm skeptical about the Jaguar's ability to "out-shoot" the 3DO as well, but I will reserve judgement until I see the machine.

And one thing has gotten lost in the technical-statistics shuffle: the Jaguar will cost a LOT less than the 3DO. The initial price of the 3DO is expected to be in the $700 range, while the Jaguar will go for $200 or less (probably $200-$150 for a fully-loaded package, and $100-$150 for a core package). Even if the 3DO drops to its expected retail price of $500 soon afterwards, it is still a wide price chasm between it and the Jaguar.

This is normal. Almost invariably when a new patchlevel comes out, old save and bones files will not work. That's because the save file format depends on internal data structures, and these change as new features are added.
(There should have been a note in the documentation to this effect.)

Strange. Did you compile this version yourself? If so, what compiler and library did you use? If not, are you using the binary from nethk311.zoo on atari.archive? I compiled that myself, and I've never had any strange problems with it. (I just tried a Samurai again, and it works fine.) The only thing I can think of that would cause bombs would be running out of memory. That seems unlikely on your system, but perhaps you should try again without the ramdisk (or with a smaller ramdisk; and/or with a different ramdisk program).

>BTW, what was the address to report
>nethack bugs to again?

nethack-bugs@linc.cis.upenn.edu. Make sure you identify your computer system (Atari) and give as many details as possible.

>I'm looking for a nicer main TeX typeface than cmr, which can IMHO
>look {\rm GHASTLY}. I'm mainly using CSTeX and a DeskJet-500.

I wouldn't call cmr {\em ghastly}, but I've certainly seen too much of it. I think that it's a case of "familiarity breeds contempt." When I installed NFSS, and was able to do some documents in cmss and concrete, the simple added variety took away a fair bit of my contempt.

>I found a file meta_con.zoo at atari.archive (really src.doc.ic.ac.uk),
>which claims to `Convert Calamus/vector fonts for use with metafont'.
>However, when I try to extract, I just get a `Segmentation font'.
>
>So, does anyone know of a working version of such a program,
>and is it worth using? (I envisage using it on, e.g., the font
>times.zoo from atari.archive).

I haven't tried it lately, but last time I tested it, it seemed to work. In extracting it, you may have SOME trouble because it uses fully specified path names, which UNIX systems are NOT happy with.

Try some combination of the zoo options:
:, ., //
and you should be able to get it extracted.

>Alternatively, are there any other suggestions for a cmr-substitute?
>Ideally, I want metafont source. I've had no luck on the comp.fonts
>or TeX newsgroups.

I've been using Knuth's "Concrete" font, which I've been reasonably happy with. The Pandora fonts are apparently fairly popular too. I haven't gotten 'em installed yet.

What you REALLY want to do is to install NFSS - the New Font Selection System, which makes it a hundred times easier to use different fonts. (If you want to use other than cmr, you'll pretty much HAVE to install NFSS, because cmr is pretty hard-wired into the "old" font selection system.)

You have got to be kidding! Quoting EGM as a reliable
source is absurd! Surely you meant to post this to rec.humor.

As for the Jaguar, it has been hyped since I started following
this news group (9-91) and still no platform! Imagine that.
Although I hope Atari succeeds they are a vaporware company
and deserve everything they get if they are forced out of
business.

I will give 3DO the same amount of time I gave Jaguar to
make it to market before I start ripping them. If they turn
out to be a vapor company also, then I will certainly voice
my displeasure.

As for the Jaguar, its due out any day now right?

(Oh and please avoid that crap of "Jaguar is already out. My
friend <insert god's gift to programming name here> has been
developing <insert more sales potential than Pac Man game
here> for over a year now." If I cannot buy one as a consumer
today, in Houston, Texas, then as far as I am concerned, it is
not released.)

>source of the info.

Ah, well if you have some citation to point us to, then great. Not
that I particularly trust EGM as an industry insider. (They've been
known to, ah, be wrong before.) But it's not a big part of anything I
said, so I'll concede the point. OK, *some unnamed people* who have
developed for both machines like the Jaguar better. Fine.

How does that "fact" (which I am granting you) change anything in my
post (which you have entirely replace with the word "worthless")? Care
to discuss any of the *facts* at hand, or are you just going to flame
me because you have a problem with what you perceive as my supposed
"anti-Atari" attitude?

>P.S. I think people would rather play a real video game than the kind
>where you stop playing and watch a little bit of video which will be
>the same every time (in other words the ability is not that important).

You're not making sense. Consider a Street Fighter II with all
movie-quality digitized video. It would be very popular. It would be
a fun game (to those who liked Street Fighter II; i.e., most of the
planet). A machine with better graphics offers a superset of the
capabilities of one without. You don't HAVE to use the JPEG
decompression to show prefab movies. You can use it to get lots of
images off your CD quickly. That's why it's useful. Digitized,
TV-quality sprites, man. Think about it.

>P.P.S. What is meant by 'Commercial Quality TEXT Adventure'?
>Isn't that some kind of oxymoron?

No, it is not some kind of oxymoron. It refers to games that are of
interest to people who like to *read*. Do you think there's something
wrong with the description "commercial quality novels?"

For that matter, as you well know, my game programming interests are
not at all restricted to text-only games.

>Where is the full-motion video?

In the minds of the players.

Agreed that this makes the difference; I think Atari must be very careful to keep their prices rock-bottom initially. They should sell to break even to get a foothold at first. By next year the 3DO won't cost so much, and Atari will be edged into a successively lower price range.

They could do it, but they *must* stick to the prices they've quoted. Even then, it won't be easy. If I were John Skrutch I'd be pretty nervous right now.

Erm...the Falcon030 is out NOW. Sure it has been delayed, but it is in stock and being shipped regularly in the UK as of now.

All atari have to do is advertise and they will be laughing all the way to the Bank.

Right now none of us know much about the Jaguar other than '64-bit
RISC'. So how do you know that the Jaguar is just 'tossing in a DSP here or
a graphics coprocessor there'?

>You're not making sense. Consider a Street Fighter II with all

>TV-quality sprites, man. Think about it.

You're not making sense. To make a Mortal Kombat (or better) type
game you need instant access to all shapes of both fighters because you don't
know which move the user will pull off next. You can't just play a segment
of video quality animation off the CD cause it's not going to be the same
every time. Are you telling me that you could poll each fighters input and
get them BOTH off the 1 CD in an instant? (that would require 2 seek times)
Any Street Fighter II type game would require that both COMPLETE fighters be
loaded into RAM before the fight.

The Jaguar thread should end NOW. The thread belongs in rec.games.video!!!

However, just to clear up a few things. Very little is known about the
Jaguar but what little known is this:

It is in NO WAY BASED ON THE FALCON. It couldn't be. The reason is the
other known fact is that it is supposed to have TWO microprocessors.
(I think two 68000. I'm not sure on that fact so don't go around saying
it like it was fact you recieved from ATARI or something).

I could see how you might say that if it were based on the Falcon you could
discuss it here but it isn't so PLEASE DROP THIS THREAD!!!

I hate to play network shepherd but.....

P.S. Dave Bagett - Shame on you. Such an experienced networker like yourself
should know better than to continue a thread like this.

Thanks everybody!

>megabucks. And of course you need fun,quality software. I think

Nintendo/Sega has proven that you don't need quality to command a price.
They have made $50 games that norm, and people pay it! Mario type games
are canned and sent out and people pay for it. Shooters that run with the
patterns over and over again... Of course, I do agree with the 'fun, quality
software part'.

Let me state right up front that I'm predjudiced, that's why I'm a sysop on GEnie instead of one of the other systems. I spent years on CIS and Delphi, a week on Prodigy, never on AOL.

If you use an Atari, GEnie is the clear winner in Atari support and activity.

In my opinion the administrative philosophy on GEnie is much more human and less machinelike than I found CIS. I haven't been on CIS in the last year or two but I hear they are faster than GEnie. GEnie is too successful, they keep growing faster than we can get GEIS (General Electric Information Systems, the parent company who provides Fortune 500 type mainframe service during the business day) to provide hardware resources. Genie is also the price winner in value for the buck. On the ST the frontend available free for the download time, STAladdin superior to anything any of the other services provide, even AOL. In this the ST and Amiga users have a clearly superior program for automating online use.

The best way to find out which one you like best is try them. In GEnie's case they will refund the $4.95 you pay for the first month, if you don't like it after a month. Couldn't be fairer.

If you do come on and have any problems, send me an E-mail at GE mail address D.FLORY, and I'll try to help. You'll find lots of help, everywhere you go on GEnie.

As I understand it, The Performa 400 and 600 are almost identical to the
Mac II vi and vx...NOT the LC2. The Performa series have no socket for an
FPU as Apple assumes if you want one, you will go with the more serious II
series Mac. The Performa 400 does, however have a 32 bit data path, NOT
a 16 bit path like the LC2.

This is a little off-topic, but am I the only one who doesn't like realistic TV-quality graphics for computer games? I actually prefer hand drawn graphics to realistic digitized graphics.

For example, I was never impressed with Pit Fighter because the sprites were just digitized human actors. It sort of ruins the fantasy for me. If I wanted to see completely realistic humans fighting, I could just watch a movie instead.

In addition, using digitized graphics takes away some of the artistic qualities in game making. In my opinion, it takes a lot more skill to design a game with hand drawn Disney-like graphics (i.e. Sierra games) than to just take a video camera and digitize a human wearing a costume.

And in some cases, it might not be as good either. Consider the X-Men video game in the arcades. To me, it wouldn't be as good if the sprites were constructed by digitizing photos of actors wearing X-Men costumes. In this case, the cartoon-like graphics is actually an asset.

3845. Can we get a comp.sys.atari.falcon

Newsgroup: comp.sys.atari.st
Date: 1993-03-09 20:05:16 UTC
From: wintermi@cs.aston.ac.uk
Message-ID: <1993Mar9.200516.3460@aston.ac.uk>
Source record: 209082

I have an idea that would be of benefit to alot of the people who use this news group. Could we not split the group into two halves, splitting the ST and the Falcon apart, as they really are two different computers even if about 80% of all ST software will work on the Falcon (Serious Software). We should still split the two and create some new groups, this will reduce the amount of postings that an ST user who does not want to hear about the Falcon has to go through.

I am getting a Falcon myself and would like to see some new groups especially for the Falcon computer, maybe the following would be good :

comp.sys.atari.falcon
comp.sys.atari.falcon.tech
comp.binaries.atari.falcon
comp.source.atari.falcon

I think that this should be of benefit to us all, as the Falcon will soon become a well known computer. About March 24th I would say, inline with the CeBit show, when the consumer Falcon is released in the UK, and the Falcon040 is shown to the public for the first time.

Matthew.

You do know that weakens your position considerably. Here we have
hard facts on the 3DO, while the most we know about the Jag is
what you've heard "other people" say.

> Any Street Fighter II type game would require that both
> COMPLETE fighters be loaded into RAM before the fight.

True. But you have to store all that data somewhere. CD-ROM has that
capability, while cartridges are a lot more limited. Heck, you could
have different (but similar) animations for the same character, and then
randomly decide which one on the set gets loaded for any particular fight!!

>a graphics coprocessor there'?

Look, get a grip! Not knowing exactly what the Jaguar's eventual specs
will be has no bearing on the validity of the previous paragraph. The
fact is (again) that the 3DO consortium has done MORE than just throw
in some nice chips. In particular, they have some very nice software
to go along with it, and the development system runs on Macintoshes,
which makes for a nice environment. These are FACTS.

I *don't* know that Atari has just thrown in some nice hardware. The
point is that IF THEY HAVE, then they may not do well against the 3DO.
If they have done more than that, then they may have a chance in spite
of their underdog status relative to the consortium. The conclusion is
simply that it is NOT reasonable to say the Jaguar is competetive with
the 3DO simply because it has a 64-bit graphics coprocessor, a DSP for
audio, or whatever the rumored specs of the day might be. There is
MORE that determines the success or failure of a video game console
than just the hardware in the box. And the 3DO consortium is doing
very well with these "other things," many of which I mention in
previous articles.

Clear?

You would need to have all the image data for the two people/creatures
currently fighting in memory at once. But not the data for *all* the
characters. So with the 3DO you could very well have 150 different
digitized, better-than-TV-quality characters to fight against, because
you have room for that kind of data on the CD with JPEG compression.
It is clearly important for the machine to have a reasonable amount of
RAM. The 3DO seems to; I'm not sure exactly how much it has, though.
In any case, there's no way in hell you could fit that kind of data on
a cartrdige.

The same applies to music. You can store a lot of CD-quality music on
a CD. You can't on a cartridge. So you could load the song for the
current screen off the CD, and then play it from RAM. You could have
dozens of full-length songs on the disk, though.

The Jaguar must have a CD-ROM drive and good image compression
capability to compete with the 3DO in this regard. If you just can't
see how massive amounts of digitzed 640x480x24bit image data could
improve the average graphics game out there now, I don't know what to
tell you.

I expect what you'll actually see in practice will be digitzed images
that have been touched up good artists. The point is that it helps to
have images of people, animals, and vehicles (etc.) in natural movement
sequences, so you have something to work from.

>For example, I was never impressed with Pit Fighter because the

Ok. Please do so! We'd all like to know just what the actual specs are
on *both* of the machines... though it seems that the Jaguar's haven't yet
been set in stone. Have the 3DO's?

All I've really seen of the 3DO is are the pictures that have appeared
in a couple of the recent magazines. Apparently we're all supposed to be
really impressed that the 3DO can texture map semi-transparent bitmaps onto
a cube. Who cares? An IBM XT can do that. None of them seem to be concerned
with the question of whether that's supposed to be happening in real-time or
not...

Game companies don't care what you want, they only care about what you will spend money on. The most popular games now are all very glitzy. While glitz and gameplay aren't necessarily contradictory, the gameplay doesn't seem to be as important as the glitz these days. (Consider how popular the Sierra games are compared to their more interesting Infocom cousins.)

Nowhere did the above individual say a word about pulling data in
real-time. He merely stated that one could get "lots of images off quickly"
and they could be "digitized, TV-quality images". This is perfectly
reasonable to assume, as is the assumption that any decent console these days
would have enough RAM in it to store the images needed at that particular
point in the game.

So, what *is* your point?

>The Jaguar thread should end NOW. The thread belongs in rec.games.video!!!

It WAS in rec.games.video before you took that out of the newsgroups line. It also is in comp.sys.atari.st, mainly (I assume) because the Jagaur is an ATARI machine rumored to be related to the FALCON and coordinated (on the software end) by JOHN SKRUTCH, who heads the game development group at Atari HQ in Sunnyvale.

>However, just to clear up a few things. Very little is known about the
>Jaguar but what little known is this:
>
>It is in NO WAY BASED ON THE FALCON. It couldn't be. The reason is the
>other known fact is that it is supposed to have TWO microprocessors.

OK, so why do you conclude from this that it couldn't be based on the Falcon? "Based on" doesn't mean "identical." If it had an extra DSP (also a microprocessor), would you claim that it couldn't be based on the Falcon? The Jaguar could very well have, for example, the same video hardware as the Falcon (as has been speculated).

The fact is that, like the rest of us, you have NO IDEA what this machine is, or whether it even exists at all. But whatever it is, it better have some serious "Power without the price" to compete with the 3DO, and it's too early to be putting money on one or the other.

3861. Flaky Mouse Port -- Need Advice!

Newsgroup: comp.sys.atari.st
Date: 1993-03-10 02:53:10 UTC
From: palefox@carson.u.washington.edu
Message-ID: <1njl6mINNjfa@shelley.u.washington.edu>
Source record: 209100

Hello, fellow Atari users!

I've been having major mouse problems. First I thought that my mouse was bad, so I first fixed it, then replaced it. Neither of the two fixed the problem. This led me to take a closer look at the problem; turns out that I can activate the mouse by jiggling the mouse port.

I want to fix this myself, but since the Atari's internals are unfamiliar to me, I thought I would ask first if this is something easily repaired. Any similar experiences?

Thanks in advance!

Dagmar

3863. Kill Jaguar Thread Post Reply

Newsgroup: comp.sys.atari.st
Date: 1993-03-10 04:07:27 UTC
From: mrz5149@ritvax.isc.rit.edu
Message-ID: <1993Mar10.040727.15660@ultb.isc.rit.edu>
Source record: 209006

Dave, I think I may have been unclear in my message:

1. It is my intention that these messages ceace to be cross posted
to comp.sys.atari.st seeing as there is very little known about
the Jaguar and thus there is no real way to relate it to the
Falcon.

2. Not to offend you.

Sorry that #2 wasn't pulled off very well. If you took offense, sorry.

I just wish that who ever (or what ever) arbitrates cross posting would
do it more concientiously. It seems that when anything gets cross posted
from another base with even the SLIGHTEST hint of flame or misinformation
the entire network community jumps on it and comp.sys.atari.st gets filled
with garbage. While I have the benefit of a KILL file I choose not to use
it (who knows when a good tidbit could fall under a kill) and there are
those who have access to the net that don't have the benefit of KILL files.

Now on to a little bit of a reply to the second part of your message.
To me, *hypothetically* (since I have no idea what the Jaguar actually has)
if the Jaguar has two main CPUs that the architecture would have to be
incredibly different. Think about it. How in the heck could something
that different in basic architecture be anywhere based on something
else so different. To say the a two processor Jaguar was based on the
Falcon is silly. It would be like saying the Falcon is made by ATARI, the
Jaguar is made by ATARI, the 800XL is made by ATARI, they must be based
on each other!

The other reason is that Falcon development and Jaguar development took
place in two different parts of ATARI. While I'm sure that the Jaguar
could have a DSP and some Falcon like things like True Color it still
doesn't mean it's based on it. The NeXT has a DSP and (I think) has
True Color but that doesn't mean the Jaguar is based on the NeXT!

Please, don't take what I say as a bash or flame to you. Just discussing
the idea. However, I suppose that by the very post of this message I
am undoing what I originally set out to do...Get rid of this darned
thread!

To others reading: Please keep on topic and don't follow this poor example!
I violated my own golden rule of keeping topic. Yikes!

3866. Help: Configuring 1.2 Gb Fujitsu HD

Newsgroup: comp.sys.atari.st
Date: 1993-03-10 05:18:24 UTC
From: dunham@src.honeywell.com
Message-ID: <1993Mar10.051824.14391@src.honeywell.com>
Source record: 209003
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have an STE with a SupraDrive 30 Meg HD (later converted to a 60 Meg with a Seagate ST177N SCSI drive).

Now I have a Fujitsu M2266SA 1.2 GigiByte HD that I'm trying to connect via the SCSI daisy chain, but I can't get it to work. I removed the terminator resistors from the Supra because the Fujitsu has them and is last in line. The Supra ID is SCSI: 0, Device 0. And I set the Fujitsu to SCSI 2.

But when I turn on the Fujitsu (with it's own P.S.), the Supra makes weird noises. Neither drive is recognized by the computer. If I unplug the Fujitsu SCSI cable from the Supra, and restore the Supra resistor terminators, I'm back online with that drive. I've tried the Fujitsu as both SCSI and SCSI-2. No luck. I also tried running the Fujitsu from the Supra power supply and controller, in place of the Seagate, but only the green light blinked (not enough power??)

Has anyone connected such a large drive to an ST before? Help!

3867. Printing text sideways

Newsgroup: comp.sys.atari.st
Date: 1993-03-10 05:57:06 UTC
From: vicb@clark.edu
Message-ID: <1993Mar10.055706.20803@clark.edu>
Source record: 209097

I need to find a way to print a text file sideways on my printer. I have a 24 pin dot matrix, Epson LQ compatible. Anybody out there have any ideas of where to find such an animal? I'd prefer something for my ST, but if you know of something for my PC, that would help also. I'm trying to print out a spreadsheet file (OPUS) that is too wide for the paper, so I'm thinking of dumping the thing to a text file and printing it out with the proper utility, if such an animal exists.

Any ideas?

Thanks,

Victor Bruhn
vicb@clark.edu

3868. Re: Jaguar vs. the 3DO (was Re: Atari Jaguar)

Newsgroup: comp.sys.atari.st
Date: 1993-03-10 06:33:50 UTC
From: wilsont@rahul.net
Message-ID: <C3nu8E.BvE@rahul.net>
Source record: 209004
Cross-posted to: comp.sys.atari.st,rec.games.video

Some Tidbits everyone should think about:

On the 3do:
Recently in the paper here (San Jose aka Sillicon Valley), the 3do 'group'
was looking for employees, to me, this means they are getting started.
the 3do looks like it will be $700
The 3do seems to be a CD-I/CDTV type of machine, not game console every
household would have.
Have working models or prototypes been seen?
I have seen mention that the 3do only has a 64k framebuffer,
a conflicting report says it has no video ram, that a chip decompresses data
and spits them out to DAC's
It has JPEG decompression on chip.

On the Jaguar:
In december, atari had a employee want ad, it stated: come work with
the new 64bit game console, the jaguar.
Atari has been around a lot longer than 3do, but no one seems to know that
nowadays unfourtunately.
Bob Brodie answered 'better than that', when asked if the jaguars graphics
were better than a neo-geo's
The jaguar has a 64 bit risc chip, it is unknown if its the main brain
or what it does.
The jaguar release date has been mentioned to be late summer.
The jaguar is targeted at under 200 dollars.
the jaguar is supposed to be a game console. it will use the new
15 pin analog joystick ports, that also supports a 12 key-pad.

General:
CD's hold about 660Megs and have access times of ~120ms with 300k/s
(on a good day, SCSI interface)..(have they improved these times?)
64k of vram ain't much.
2Megs of cartridge is a pittance compared to 660.
cartriges mean zippy fast access.
It is unknown if either machines capabilities have been set in stone.

Personal opinions:
I hope joysticks with fire buttons on the left side make a comeback.
the 3do and the jag are not in a competing arena due to price margins.
Hopefully, everyone will drop the crosspost to alt.games.lynx

There is no such thing as an 'illegal' (in the sense of 'undocumented')
opcode on an 680x0 processor. All illegal instructions are trapped
by the microcode.

Someone may have already mentioned this (I'm about a week behind in this newsgroup) but an easier way to run sym-ld is:

gcc -B/usr/local/gnubin/sym- -o foo.sym foo1.o foo2.o

Of course change /usr/local/gnubin to the path to your gcc executables. The advantage is you don't have to specify a full path to a crt0.o file nor to the library (you can use -lsomelib).

Also, I don't think there's any need to use gcrt0.o when sym-ld'ing, unless you want the profiling startup code (in which case you should have compiled all your object files with -pg as well).

cheers,

i remember a line in the middle of the SCSI bus (forgot the name, sorry,
pleas look at your papers) which can be powered by each side. Only one side
should be enabled, of course! Maybe both of your drives try to power
the bus? There should be a jumper for that...

btw: running a 600Meg Siemens drive, works fine, fast and quiet with my 520ST.

Keep hackin'
Walter.

I think it would help if you were a little more specific here. I use a lot of
different GUI's which all have good and bad points which may be specific to
the application they interface too.
Reading between the lines a little I get the impression that what you really
want to know about are peoples windowing systems/window manager interfaces, but
I can't be sure.
Could you follow up and be a little more specific?
Thanks.

Rob.

Imperial University has a mirror site of a.a.u.e. which updates
regularly.

ftp src.doc.ic.ac.uk

and go to /computing/systems/atari/umich for thje files. Helps and
Indexes are liberally scattered around.

If you have JANET access, you can also try hooking up to hensa.micros,
but noter that this useses hhcp, not ftp to get files.

Sam.

: >only interested in hello.c type programs, I'm assuming that anyone
: >going to the trouble to get GCC is probably interested in bigger
: >projects.

: Yup, I've been compiling a project consisting of about 30-40 source
: files. About 3000 lines of code all together. Not huge, but
: certainly not hello world. Takes about 10 minutes to compile
: everything. As I said, not the fastest in the world, but not bad
: considering what I paid.

: >I'd be curious to hear how this works out.

: I'm curious as to why you insist on telling everyone that the ST
: is so crap. You really don't know what you're talking about.

I don't think I said anything about Atari being crap (though I have
in other posts in the past). All I said is that GCC is a resource
hog and that the system described above seemed a little "under-resourced"
to have a workable GCC development system on it. Why are you so
defensive? Is this the computer version of Napoleon complex??? :-)

I think I do know what I'm talking about. I've been using GCC and
most of the other gnu tools for a while on my unix box. While you
might think that 10 minutes is a decent performance figure for
compiling 3000 lines of code, I do not. In 10 minutes, I can
compile emacs (which consists of about 10 megs worth of source)
while running X windows and unbatching compressed news all
at once on a "lowly" 486-33mhz machine. And while this is all

going on, other people can use my system by dialing in.

Sheesh, I said I was interested in hearing about such a system,
not fielding flames from an insecure Atari user.

Regards,

Chris

>2. Not to offend you.

Look, you didn't offend me any more than you offended anyone else by demanding to have things YOUR WAY in a situation that is hardly black and white.

>I just wish that who ever (or what ever) arbitrates cross posting would
>do it more concientiously.

Usenet is an anarchy. YOU are in charge as much as anyone else. Likewise, you have the same say as everyone else in such matters.

>While I have the benefit of a KILL file I choose not to use
>it (who knows when a good tidbit could fall under a kill) and there are
>those who have access to the net that don't have the benefit of KILL files.

If you don't use a kill file, you will have a hard time justifying your complaints about the low information content of this group. Every few days now someone will moan about how no one posts "anything interesting" and how the "Nasty {PC/Mac/Amiga/3DO/Apple II/Cray II} People" should post in *their own* group. Of course, such moans never inject any useful discussion either, and they *always* generate more flames.

>Now on to a little bit of a reply to the second part of your message.
>To me, *hypothetically* (since I have no idea what the Jaguar actually has)
>if the Jaguar has two main CPUs that the architecture would have to be
>incredibly different. Think about it.

I understood what you said, I just don't agree with it. The CM-5 (the most recent connection machine) is based on Sparc chips. Once it runs Unix (it may already), it may appear quite similar to the programmer to a Sparcstation (albeit a very fast one). One could argue that the CM-5 is loosely based on a Sparcstation then. (Yes, that would be somewhat extreme.)

The point is that you don't know, and even if you knew for sure that the Jaguar had two 68030's on it, you still couldn't know whether or not it was based on the Falcon.

>The other reason is that Falcon development and Jaguar development took
>place in two different parts of ATARI.

Who developed the Jaguar, then?

>Please, don't take what I say as a bash or flame to you. Just
>discussing the idea. However, I suppose that by the very post of this
>message I am undoing what I originally set out to do...Get rid of this
>darned thread!

The offensive part was not the flaming, but your trying to censor
people here without considering that they might feel their threads are
relevant and appropriate.

>To others reading: Please keep on topic and don't follow this poor example!
> I violated my own golden rule of keeping topic. Yikes!

Sigh. No one likes net.police.

>(1) ... Which version of PovRay should I get (ie Unix IBM)?

All of the source files are (vertually) identical for Unix
X-windows, Amiga etc, there are only two files that need to be changed.
These are the config file, and then<machine>.c file.
For the ST version, the unix.c file should be okay, since it does not
display the picture while it is working. The config file should be easy
to change. Take a look at the config file for other machines.

>(2) ... What can I use to compile the code on the ST?

I'm not sure, because I haven't actually done it. I really wish I could
but I suffer from the 'lack of HD and more RAM' problem.
I seem to remember a while ago that someone mentioned that they had
compiled it for the ST, but they had not upload the binaries anywhere
bacause they had not received permission from the POV team(they had been
waiting a number of months).

Unlikely. And probably not possible (with CD-quality music). More likely,
it would play the music directly off the CD. There is certainly not enough
space for "dozens of full-length songs", even if there wasn't a game on the
CD as well. Please, be realistic.

>hog and that the system described above seemed a little "under-resourced"
>to have a workable GCC development system on it. Why are you so
>defensive? Is this the computer version of Napoleon complex??? :-)

I'm not defensive at all. You asked why anyone would install GCC unless
all they wanted to do was compile 'hello world'. I told you that it
was quite possible to do a very reasonable amount of work on such a
system.

>I think I do know what I'm talking about. I've been using GCC and
>most of the other gnu tools for a while on my unix box. While you
>might think that 10 minutes is a decent performance figure for

I never once said that 10 minutes per 3000 lines was decent performance.
I said that it was 'not the fastest in the world, but not bad considering
what I paid'.

> In 10 minutes, I can
>compile emacs (which consists of about 10 megs worth of source)
>while running X windows and unbatching compressed news all

Sure, and I can do all of that on the "lowly" Sun IPC that I'm using
at the moment, and I much prefer it! However, I got my ST up and running
for about half the price of the PC, and much less than this IPC.

>Sheesh, I said I was interested in hearing about such a system,
>not fielding flames from an insecure Atari user.

Not an insecure Atari user, just one who gets annoyed with people
(not just you) who presume that since the ST has a mere 8MHz 68000,
it is useless for anything serious. To tell you about my system,
I have a 4M ST, a 50M hard drive and an Atari Mono monitor (probably
their best product!). On this, I have a multi-tasking OS (Thanks, Eric!),
gcc, gdb, LaTeX etc etc. All this cost me about #500 2 years ago. A Cray it
isn't :-), but it's quite good for just messing about on. If I ever

have some spare cash, I'd probably get something better. As it is,
the ST does it's job, and I've got other things to spend my money on.

Cheers,

Steve

Nope, sorry, Darren. The Performa 400 is a clone of the LCII. The Performa
600 is a clone of the vx (the vi was the non-US version of the vx and has
now been discontinued). And once again, the 400, being an LCII clone, has
only a 16 bit data path. The new 25MHz LCIII has a true 32 bit path.

Well said, Dave. Let me second the motion, folks. GEnie is THE place to be for online support of Atari users and it's a bargain compared to CIS even with CIS's reduced rates. Do yourself a favor and check it out.

You doubtless have cracked solder on the mouse port pins....

(5 of 5 problems like you mention I've fixed)

Observe static discharge precautions! Ground yourself to the ground-plane of whatever you're working on. Even if it's just grabbing a ground with your hand before doing anything else. Do it regularly! First thing before touching anything else, everytime!

1 remove keyboard
2 remove 20 or so tiny screws from keyboard
and 2 "normal" screws near mouseport.
3 Seperate PCB form key-mechanism. Keep careful track or where the silicone (rubber?) cups with carbon pellets are.... They tend to fly about when things get shuffled!
4 heat pins of mouseport (joyport too!), maybe add a bit of fresh solder
5 reassemble!

|> Right now none of us know much about the Jaguar other than '64-bit
|> RISC'. So how do you know that the Jaguar is just 'tossing in a DSP here or
|> a graphics coprocessor there'?

No, I think he is implying that having a graphics coprocessor in a system
or a DSP for sound or other things in any <generic game system> that you
do are nice things but 3DO is offering a good solid software developer
support. He's implying in generic terms that the Jaguar would have some
kind of custom graphics/sounds subsystem.... hey, if this assumption
cannot hold, the Jaguar is crap even before it gets out.

You understand wrong. The 3 Performa machines (200, 400, 600) are nothing more then renamed previous Mac models.

Performa 200 == Classic II
Performa 400 == LCII
Performa 600 == IIvi (sort of)

There were NO designs of hardware, just a name change.

3898. Re: Logic Simulator

Newsgroup: comp.sys.atari.st
Date: 1993-03-10 15:50:57 UTC
From: Craig.Graham@newcastle.ac.uk
Message-ID: <C3oK0y.3yC@newcastle.ac.uk>
Source record: 209037

Another logic sim. is CLA (shareware from most sites (but NOT a.a.u.e)) released July '92. Only runs in B&W, allows hierachical block structuring & has a fair few basic gates. Uses GDOS for output of design's / simulation results.

Has a bug in the V1 release 1 which prevents use on anything but a 1Meg machine (highly embaressing).

Blatent plug coming up.....

---------DATA UNCERTAIN PRESENTS---------
---------CLA V2---------

New release due 'RSN' with massively improved features:-

* Falcon compatibility (guarenteed - that's our developement machine now)

* Support for extended grafix modes (TT/Falcon).

* MultiTOS compatibility.

* .GEM metafile output (designs & simulation results) - compatible with Pagestream,Calamus,Hyperdraw, etc.

* Extended GDOS support from V1 - option to use GDOS fonts in place of Generic vector fonts.

* SPICE model output for analog simulation.

* New Multi-Window editor with selectable Scale/Scroll display modes

NOTE:'RSN' is copyright Atari Corp. It's use in this context is meant to imply 'sometime in the next year'.

If Marcel Boom or Andy Gann are reading this, hi there.....

From: Craig.Graham@newcastle.ac.uk
Message-ID: <C3oKJF.5Dz@newcastle.ac.uk>
Source record: 209038

In my view, the discontinuing of the STE is the final nail in atari's coffin.

I own a Falcon myself, but am astonished that Atari would even consider discontinuing the only computer which they can supply consistently (as a F030 owner, I know exactly how hard they are to come by, but that's nothing compared to how hard the software is to come by).

This is ridiculous. There is NO Falcon software on the shelves. There are NO Falcons in the shops. With the STE out of production, this will mean NO ATARI in the shops. The name will fade......

Luckily, the 680x0 version of Linux is due soon, so I'm adding a faster processor & fast ram board & going UNIX as soon as I can. This move will pain me more than word's can say, but the death of the STE shows me that Atari is abandoning me, & the rest of the Atari community, so we must all make our own ways.....

3902. Atari ST stuff for sale: Okimate 20 printer, Printmaster Plus S/W

Newsgroup: comp.sys.atari.st
Date: 1993-03-10 16:16:37 UTC
From: georgew@tekig1.PEN.TEK.COM
Message-ID: <9112@tekig7.PEN.TEK.COM>
Source record: 209034
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other

Printmaster Plus program for Atari ST $10
Make greeting cards, etc. Works with most 9-pin printers and Okimate 20.

Okimate 20 color printer $50
My kids used this a lot for color screen dumps when they were younger, but they're into DTP now, so I bought a 300 DPI printer. This is the Atari ST version of the printer, which emulates Atari SMM804 graphics (basically Epson 9 pin) as well as doing color screen dumps and 24-pin NLQ text. Included: 2 1/2 black ribbons, 1 1/2 color ribbons, and about 250 sheets of fanfold paper. Doesn't include printer cable, since it uses a standard Centronics cable - about $10 from any computer store. Also, the current print head has one of the 24 pins burned out; new ones cost about $20 by mail order and just snap into place. I'll enclose an order form from the company that sells paper, ribbons, and print heads.

All of the above come with original boxes and manuals, and I'll pay shipping in the continental U.S. (Extra charge for COD.)

Message-ID: <1993Mar10.171824.23116@ultb.isc.rit.edu>
Source record: 209048

My intention is not to censor at all nor to "get my own way". I just think
that it might be nice for a base called comp.sys.atari.st not to contain
more messages cross posted from rec.games.video. Especially when they
contain, for the most part, little having to do with the base at hand.
I am not calling for this base to be moderated or censorship or anything
so nasty and facist, just smarter cross posting.

Just for the record I am not the only one calling for this thread to come
to an end.

Now I know I've been a little soap-boxish in my last letters but I feel
that lately (and I'm sure many others would agree) that the amount of
garbage flowing through this base in the past weeks alone have been
atrocious (sp?). Kill files are great. I can use them (and if it gets worse
I really will have to start using it more often) but what about those who
don't have to access to this feature? Is it really fair to ask these people
to have to read messages that have nothing to do with the base topic?

I don't plan to post anymore on this topic but I put it up as food for
thought. If you don't agree with my views you have that right. So let's
get back to some ST talk? Hmmm...

>Email whoever compiled your version, don't bug the NetHack Dev Team with
>implementation-specific problems... They won't have a clue what to do
>about it!

Actually, that's not the case. The Atari ST is one of the "officially"
supported platforms for NetHack 3.1, and there is a dev team member
(yours truly) with some Atari knowledge.

But you're quite right, of course, that we can't be responsible for every
compiled version, since we can't control which compilers and/or libraries
other people use. I compiled the 3.1.1 version on atari.archive (which will
shortly be appearing on linc.cis.upenn.edu as the "official" binary)
so I will take responsibility for that one.

>I intend to compile a full ST version (and add sound support, like the
>Mac and Amiga ports) as soon as Hildo fixes GNU make;

If you do add sound support, please send us your changes!

I own an STe, and ever since I bought it about 1 1/2-2 years ago, I thought it was behing xxx behind the times. Yes, the f digital sound is nice, but come on: 68000 running at 8MHz? The way things are going on other platforms, the TT030 and Falcon030 should come in as medium-weight machines (soon to be entry level). Yeah, I like my STe, but I thinkits time for Atari to move on to better things.

One other was a Radio-Control model simulator, which used software on
a cartridge together with a Futaba RC transmitter case connected to the
cart via a lead from where the ariel would normally be. Rather pricey,
but realistic & cheaper when you lose control of the plane/glider/helicopter!

Gwyn

Okay great. I know about CLA, and I remember last year it was still on a.a.u.e
(v1.0) that is.

Now the obvious question... is there an ftp site which DOES have CLA, and if
so, where is it???

Email answers welcome, so is posting to this group... I read it almost twice
a day!

Actually, I live in Canada; that's what the .ca part of my address
means.

Anyway... Before Atari Canada was "right-sized" (ie, put out of
business by Atari in Sunnyvale), TTs were available in Canada. Now,
they're _more_ expensive than they were before, _if_ the dealer can get
them! Yup, Sunnyvale is sure taking care of Canada, which has always
been a better market for the ST/TT line than the US is.

It'd also cost major $$$ to ship a TT back here from Germany... and I'd
probably have a hard time dealing with the German TOS/keyboard.

Rumour has it that there are tonnes of nifty XFS drivers available from
ftp sites in Germany... RAMdisks, RAMdisks that support real-time data
compression, neat things like that (I'd like an extended filesystem that
managed to be TOS-compatible, so I don't have to minix my partitions).

Unfortunately, I can't ftp, so I can't poke around or tell you what
sites to look on. :-(Maybe someone could give us a pointer, or upload
some of the excellent German MiNT software to atari.archive?

This is hard to believe, why is this? Did they move the sound chip registers
in the address space, causing a bus error? That would be real hard to believe.
I thought I heard somewhere that Dungeon Master worked, for example. And
that Neil Forsyth(sp?) got Game Workbench to work on a Falcon (except for
the video address change problem). I assume GW attempts to use the sound
chip? Can someone with a Falcon enlighten?

|> Developers who apparently have had experience with both systems
|> seem to be more impressed with the Jaguar. Does that affect you
|> in some way?

Actually, there have been several articles in some well respected publications
indicating that 3Do is incorporating video compression into the hardware.
Furthermore, a couple of random comments from some unnamed developers
does not have any effect on me at all. I'll believe it when I see it! Which
by the way, the 3Do has been demonstrated in several public forums unlike
the mythical Jaguar.

|> > (You can do a 30-minute movie in better-than-TV resolution, for example.)
|>
|> I'd rather watch a full-length movie from a laserdisc thank you.
|>

Which is one potential feature that 3Do is working on , whereas the
rumours of Jaguar do not indicate any such video playback capability.

|> > The 3DO comes with a CD ROM drive. It has software and hardware meant

|>
|> So you don't know if the Jaguar will offer options or come in several
|> models? What exactly do you know about both systems?
|>

No, but the < $200 price tag does not indicate CD capability. Furthermore,
most of the arguments here have focused on the "base" machines and the
big price tag of the 3Do. If we add options to the Jaguar, then we also
have to take into account the increased price.

|> >
|> > Add to all this the fact that the 3DO developer's kit is said to come
|> > with 100+ CD's of video clip art (aka stock footage)that you are free
|> > to use in your games. (I.e., they've already gotten permission for
|> > this.)
|>
|> So 3DO users will pay to see identical clips ad nauseum?

Not! One of the partners in 3Do is Time Warner. Which by the way is a company
that owns the world's largest entertainment video library. Which could be
made available to 3Do developers. How about a game in which you are Sam
Spade (as played by Humphrey Boggart)?

|>
|> >
|> > From a developer's standpoint, there's a lot more to a console machine

|> you will take the risks and responsibilites and demonstrate
|> your competence in a cutthroat consumer electronics market.

Actually, MSX is a HUGE success in Japan, unlike Atari and Commodore.
It failed in the US due to the lack of interest in 8 Bit computer OSes.
I suspec that the popularity of MS DOS and MAC OS did more damage to MSX
than the Atari ST.

|>

|> Epyx companies that now lie in oblivion?? Many of their principals
|> are now at 3DO I understand. Now *THAT* is deja vu all over again.
|>
|>
|>

You logic is a bit convoluted. First off, just because NEC is a huge
conglomerate does not mean that they can be successful in the video game
market. In fact, being that large is probably a strike against them.
Secondly, the Lisa was the forerunner of the MAC and the II and III had
basically become obsolete. There is no evidence that the power PC will
have a detrimental effect on the Macintosh market. It may offer a pathway
to a future for current Mac owners. Finally, THE principal of 3Do is
Trip Hawkins, the man that built Electronic Arts fromthe ground up and
has so far been successful in getting some of the largest companies in the
world to support the 3Do. Where is Atari? They have an "unofficial" machine
that no one has seen except for a few developers. that no one has seen except for a few
developers.

] the video address change problem). I assume GW attempts to use the sound
] chip? Can someone with a Falcon enlighten?

It depends on the version of the motherboard. The current models are
revision 4 motherboards, which have had a substantial redesign, the
net result of being, the Yamaha Soundchip is now accessed in basically
the same way. Virtually all the current machines are revision 3 motherboards
which don't like accessing the chip in the same way the ST etc. does!

All the 'current' machines should have TOS 4.2 on a revision 4 mother
board. (Buying the 4meg, 65Meg HD model also gets you the complete
version of Multi-TOS, Speedo-GDOS, Atari-Works, Falcon D2D (Direct
to Disk sampler with limited editing facilities, (apparently)),
Breakout, Minesweeper, Sound-assigner (SAM I think, something like
System Audio Manager...). As well as a few other goodies.

While I'm at it, anyone know the difference(s) between 4.0, 4.1 and 4.2
of TOS!? (All machines have the same TOS chips BTW, they all have
support for the various countries on them, and you can select which
country you wish to have it used in, adjusting the frequency, and
language appropiately. How it handles voltage I don't know, I would
presume it has some sort of 240v to 120v step-down transformer or some
such thing. Otherwise, certain machines *do* have a different make-up!

3923. Mint/GCC/G++ installation

Newsgroup: comp.sys.atari.st
Date: 1993-03-11 03:08:53 UTC
From: jhp@sactoh0.sac.ca.us
Message-ID: <1993Mar11.030853.4557@sactoh0.sac.ca.us>
Source record: 208970

Does someone out there have the steps or info for installing
Mint and then in turn, installing GCC(or G++)?

I've managed to install Mint but I am not sure if I have
installed correctly. Is there a way a tell?

Assuming I have Mint running correctly, what is involved with
getting GCC to run(I know it's on the Distrib Kit but I
haven't been able to get that to run either). From there,
what's the trick to getting G++ running?

Thanks for the help.

3924. Outline Art 3.0 PRESS RELEASE

Newsgroup: comp.sys.atari.st
Date: 1993-03-11 04:52:40 UTC
From: dlk0ms9s@umiami.ir.miami.edu
Message-ID: <1993Mar10.235240.14645@umiami.ir.miami.edu>
Source record: 208960

I found this on GEnie last night and as I know that there is a bit of DTP talk here I thought this would be appreciated. I am in no way affiliated with DMC/ISD except I use their products.

Mark Santora
<-------------->

PRESS RELEASE

February 25, 1993

DMC Publishing
2800 John Street, Unit 10
Markham, Ontario
Canada L3R 0E2
Tel: (416) 479-1880
Fax: (416) 479-1882

GEnie: ISD
Compuserve: 76004,2246
Delphi: ISDMARKETING

Contact: Nathan Potechin

DMC Publishing is proud to announce the release of Outline Art 3.0. This long-awaited upgrade to the original Outline Art standard includes all the features that made the original famous, plus color, eps/ps export, macro keys, user-definable UNDO, context-sensitive help which explains each and every feature and more. Two variations of this program are currently available, in two megabyte or four megabyte configurations depending upon your existing hardware. When placing your upgrade or order, please indicate your specific Atari computer.

To all of our existing registered owners of Outline Art, the introductory upgrade charge until May 30, 1993, is US $49.95 or $59.95 Canadian.

The introductory retail price of Outline Art 3.0 is US $149.95 or $175.00 Canadian.

Effective immediately, the new price for the industry-standard Outline Art 1.0 is US $89.95 or $109.95 Canadian.

The July/August 1992 issue of Atari Explorer carried the winners of the second annual Outline Art contest. The contest attracted entries from professional and amateur Outline Art users, worldwide and is indicative of the position long held by this vector graphic drawing program from DMC. (Note: All winning entries are available for downloading from our library #30 in the Atari Roundtable Library on GEnie.)

The 4 Megabyte DEMO version of Outline Art 3.0 is now available for downloading. Although Save and export functions have been disabled, and the context sensitve help has been left out, the program is entirely functional and will give you a complete preview of the capabilities that have made DMC's Outline Art famous.

For further information, please do not hesitate to contact your nearest Atari Dealer or DMC directly. We will be pleased to answer any questions you might have.

Nathan Potechin
President
DMC Publishing

Thanks to all those who sent me information. The response I've had is far from what I expected, but still my quest goes on.

I still am looking for these packers:
SpeedPacker v2.0 or above
Automation v3.0 or above
SentryPacker any
Pack-Fire any
Pack-Ice v2.41 or above
Pompey Packer any
JamPacker v4.1 or above
Cameo v0.5 or above
Atomik v3.6 or above,

And these de-packers!:
Multi-Depacker v1.6, 2.0 or above by MUG U.K?
Naughty! v1.4 or above!

Again, thanks to all who've helped me thus far. If you know where any of these programs are posted, or even better, if you could mail them to me, I'd really appreciate it!
If you are in need of a packer, let me know - I will try to find it for you, and all the ones I have you can have too! I will upload to atari.archive really soon if I get enough people asking me to ...

Karl.

>and format, I get a DRIVE NOT RECOGNISED error message.
Yep, I found that quite irritating in AHDI/HDX V5.0 that if it thinks
it knows the drive it WILL NOT even look at the WINCAP file for its
parameters... it just goes and blindly trashes the drive format when
it makes a mistake doing that and won't let you correct it.
>
>I tried to partition the HD without formatting first, but I got the error:
>
>DRIVE FORMATTED WITH OLD VERSION OF HDX, REFORMAT BEFORE PARTITIONING
>
>Blimmin' great !!

You just can't trust Atari's HDX. Even the older versions don't seem to
accept some WINCAP settings, although they pretend to be formatting drives
that Atari didn't know about at the time they are often actually
just scrambling the format.
>
>Can anyone send me a copy of the 1986 distribution of HDX that WORKS ??
I could send you a HDX V3.2 that came with my STacy, it seems to do my
old SH204 and MEGAFILE 30 ok.

However I would recomend switching to Supra or ICD or something else that
actually will accept your "suggestions" as to the type of drive. Atari
can't really be trusted for alot of mechanisms!

A few months ago I bought an upgraded MEGAFILE 30 with a non-Atari
65 meg mechanism installed. HDX 5.0 completely trashed the format when
I tried it (without even asking me the drive type!). HDX 3.2 asked for
the drive type and accepted the WINCAP entry for the drive mechanism
that I edited, but messed up the 4th 16meg partition. Supra formatted
and partitioned it with no problems at all.

While I am still using AHDI 3.2 for my bootstrap, I will probably eventually
switch the whole system to using Supra...

>
>Can anyone (ie at ATARI) tell me how I can make an ATARI HARD DRIVE compatible
>with an ATARI ST ?? (the program told me to contact ATARI !!)
I don't think Atari knows how to handle hard disks correctly!

3928. Re: Jaguar vs. the 3DO (was Re: Atari Jaguar)

Newsgroup: comp.sys.atari.st
Date: 1993-03-11 06:14:53 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <77246@cup.portal.com>
Source record: 208966
Cross-posted to: comp.sys.atari.st,rec.games.video,alt.games.lynx

Something which seems to be being overlooked is that the 3DO system is (will be) supported by people who have a history of successful computer game production (Electronic Arts), while the Jaguar is (will be) "supported" by Atari Corp, which has a history of taking advanced technology and dumping it in the toilet.

The most advanced technology isn't worth anything unless there's advanced software to use on it.

The Lynx started life as a wonderfully advanced piece of hardware and look where it is today... an also-ran footnote to handheld video games.

The Portfolio was a breakthrough in portable computing.. today it's not even an interesting curiosity.
The ST was revolutionary at its introduction. Today it's as dead as the VIC-20.

Maybe THIS time Atari will get it right... maybe THIS time they'll market the Jaguar properly... maybe THIS time they'll produce enough to make it successful.. maybe THIS time they'll support it with quality software in sufficient quantity to make the system attractive to the masses of video game buyers...

I also hear Atari R&D is training pigs to fly...

There are already fairly no shops (even in Munich, Germany), that carry Ataris.
Buying an Atari 1040STE is really difficult in these days ... because you have to
search the whole city to find a shop selling Atari software and hardware (unless
you know these shops).

> 4M RAM; 80M SCSI hard disk).

Ah but you still don't have the groovy 8 channel ADA hardware do you? which is
what this was all about. If I was doing music I'd get a Falcon, If I wasn't
I'd get the PC. If I only had the money for one, I'd get a PC, because I need
the PC for other things that I just can't do/won't have a large enough market
for if I get a Falcon. That said though, for the bucks if you want a 16 bit
8 channel ADA direct to disk, Falcon is it.

The above also shows the pricing disparity between Europe/USA.
>
> "Power without the price!" ceased to be true as soon as the TT was
> released.

Yeah, very sad that. In fact it probably ceased a long way before that, an ST
should be about 100 pounds by now.

Well for a start, a.a.u.e is echo'ed on src.doc.ic.ac.uk in the directory
/computing/systems/atari/umich (I think). If you don't have full internet
access they run an ftp server (e-mail ftpmail@doc.ic.ac.uk with the message
help to get the help file) which can access their archive.

And I even have the unnumbered 1986 version of HDX, but are you *sure*
that you want it?

Anyhow, to both of you, Tim and Dave, if you happen to have gotten HDX
5.0 off the net, then you will surely notice that *all* the entries in
the WINCAP file are commented out! Yes that's right! So, in the case
that it does *not* recognize the drive, which is what will happen with
an SH 204, it will just start formatting with whatever default
parameters the program uses.

I have a second disk connected similarly to the Atari SH 204, and I
ran into all the above problems. Once I uncommented the WINCAP lines,
HDX proposed all the different configurations inside WINCAP. From
there it was *smooth* sailing.

Normally, HDX 5.0 does not use WINCAP only if it detects a true SCSI
drive.

Hope this helps.

> it (it's for experts only with all the soldering involved).

Just three days ago I bought Ladbroke's RAM expansion kit and fitted it. I have *no* previous experience of soldering whatsoever, and borrowed the soldering equipment from a friend. I followed the written instructions incorrectly and had to phone their service department yesterday to find out what I'd done wrong. They were extremely helpful and clear in their directions over the phone, enabling me to complete the work immediately. It could have been easier, but not by much.

Now obviously my experience says nothing about how good (or otherwise) the company's service is when they do the fitting themselves. But I can say that their kits are good, cheap, and easy to fit. Also, that their technical know-how is excellent, and they are good at communicating that technical expertise too.

Hmm, considering that the NES and SNES hold most of the console games
market now...

Considering that Apple sells the most computers of any company...

Considering that the Mac System will run on the PowerPC when it's
released...

Considering that IBM can _afford_ to lose more $$$ than Atari's ever
seen, and still not shudder...

Considering that NeXT sold their hardware division to Canon (who will
continue to build NeXT computers) to concentrate on software
development, and that they still manage to release things in a more
reasonable amount of time than Atari...

Hi, do you think you can tell everyone what the substantial redesigns are?

I am curious to know. I am fascinated by all of the revisions that
the Falcon030 has had in the past six months. THREE that I am aware of.

Also, most developers that I know have revision 3 so I wonder if there
will be any compatibility problems with revision 4...

THANKS.

3945. GFA Toolkit, Vol II

Newsgroup: comp.sys.atari.st
Date: 1993-03-11 17:19:38 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1993Mar11.171938.26561@newshost.lanl.gov>
Source record: 208981

ATTENTION ALL GFA BASIC PROGRAMMERS

WANTED: Your routines, procedures, functions and GFA utility programs for inclusion in the upcoming 'GFA BASIC Toolkit, Vol II.' This will be a book/disk consisting of routines which the average GFA BASIC user can merge with his/her own program to carry out specific tasks.

As in Vol I (published by Taylor Ridge Books, 203-643-9673), all the routines will remain in the public domain for easy accessability. As Vol I was directed primarily at the beginner, I am looking for a bit more depth for Vol II to support the intermediate level GFA user. In addition to your procedures and functions, short, single-purpose executable utility programs are also invited as well as hints & tips.

All those whose contributions are selected will receive a free copy of the book/disk when published, full credit for their work, and the endless gratitude and respect of GFA BASIC users worldwide. :)

Guidelines for contributions:

1) All contributions must be of your OWN work and be PUBLIC DOMAIN. If it is NOT your own work, go ahead and send it anyway if you are sure it is public domain and know WHO the original author was.

2) "Short and Simple" routines, procedures, and functions are most desired. Have you developed a "short cut" for which there is no standard GFA command? Do you have a favorite tool or utility which you use to reduce programming time/chores? If so, let's see it.

3) All contributions must include full source code (obviously) and be provided in ASCII .LST format. Short routines may be sent via email or GEmail. Long listings should be sent via GEnie Fmail or via postal 'snail-mail.' Do NOT send routines/programs via UUCP!

4) All contributions should be heavily documented via comments in the code and/or another file. As a minimum, comments should explain:

a) Purpose of the code (what it does), in brief.
b) Initialization requirements (if any).
c) Parameter usage (if any).
d) An example call of the routine.
e) Compatability with previous GFA versions (if known).
f) Compatability with various TOS versions (if known).
g) Video mode (i.e., color or monochrome).
h) Remarks, hints, tips for proper usage.

5) If you own Vol I of The Toolkit (and if not, why not?),
following the format presented there will make my job as editor/
compiler much easier and nearly guarantee you a place in the book. :)

Without your contributions, Vol II will not come about so just do it!
Any questions, contact me via email, GEmail, or phone at 505-662-7236.

(with apologies to non-GFA users for taking up "their" bandwidth) :)

Hi there ,
I would like to no if FLASHBACK is coming out for the STE.I have seen
it on my mates amiga and was quite impressed by it.

Can you also tell me when FRONTIER (ELITE 2) is coming out as i have been
waiting for years for the best game EVER to come out on any machine.

THANKS

PHILIP

h>To
h>get TV resolutions on a multisync monitor, you'll need the ST adaptor and
h>an ST to multisync adaptor, or you'll need to modify your VGA adaptor. I

No! One can flip to TV resolutions with a standard VGA adaptor attached,
yesterday I saw a graphics demo do so.

OK folks, relax. In my followup to the original reply I clearly defined the boundaries of the grey-level "discernment" test I was referring to. That is, the ability of a human to resolve differences in grey level in two non adjacent areas. This may or may not be a specific medical visual test, but the context in which it was presented was articles and books written by radiologists and other medical professionals with respect to the difficulty in identifying problems in actual x-rays using grey-level only shading. The intent of the articles was to highlight the need for either artificial colorization (ala landsat images) or for interpretation of grey-level images by computer. Nowhere did I mention whether the boundaries between 256 (or whatever) color intensities were visible, or what the other capabilities of the eye were. My original post was in response to another's claims about the human eye's capabilities, and it may have been slightly out of context but at least I eventually defined my context. Please do not jump all over someone's postings when it is clear you haven't been following the entire thread or reading one's followups! Sheesh! Take a pill!

So long,
Ken.

k>If the "Performa 400" means LC2 in English, it has a 16-bit path to memory,
k>just like the Falcon. (Probably where Atari got the idea).

The "Performa 400" is a new series with some differences to the LC II model so
the memory path is 32 bit and it hasn't any fpu socket (even no place for a
Nubus card!).

Regards,
Robert

HC> You will sometimes run across programs that can't be compiled in 2 MB of
HC> RAM, these tend to be cases where the author chose to write everything in
HC> a single source file instead of splitting functions into separate files.

... rest deleted ...

From my experience I can tell, that the size of the file doesn't
really matter. I've compiled the old GNU Make 2.xx, which was
basically one large source file with 145Kb on a 2.5Mb ST with 512Kb
ram disk for temporary files.

On the other hand I couldn't compile a 28Kb file on the same
configuration without removeing as much from memory as I could. This
28Kb contained one function, which alone was 14Kb in size, with heavy
inlined code (getc).

So, the real limiting factor is the size of one function and not the
size of the source file.

Well, Brodie has been talking about the two developer conferences that
have already been held for the Jaguar, so somebody must know about it.
Obviously bound and gagged by NDA's. 8^}
Sure hope they have more luck (brains?) manufacturing Jaguars than they
have had with Falcons. If they take much longer, Apple will have a
040-based LC4 out for the same price. ;}

Ever heard of Data Compression?? I don't know too much about JPEG compression,
but I seem to remember it being based on the FREQUENCIES of the light involved..Well, why
can't that be used on MUSIC?? Songs are also just collections of
frequencies, exhibited in a different method.. I'm sure someone could adapt jpeg
compression to songs.. You wouldn't get 100% CD quality sound, but probably 95% or better..

Well, I spoke with Dave a month or so ago and the story was that they were swamped with work, hustling to get SST's out the door. He didn't mention Megatalk boards, however. And as far as Spectre GCR's go, he said that ever since it was introduced, they still have never caught up with backorders (my, wouldn't that be nice.) :) So they are alive, but perhaps not too well.

```

They'd mean the Falcon-030. There is no such thing (even in known plans) about an 'Eagle-030' (Atari would be pretty thick to release *another* 030 machine with virtually the same spec's anyway 8-)

It also has 8-audio channels in and out! Not, 2-in & 2-out (My 8-bit has 4-audio out....)

If you want info on it, get the info' file from atari.archive.umich.edu in the atari/Falcon/ directory! (filename f030.lzh or some such thing).

A lot has changed since, I'll have to try and scavenge all the latest info' from Bob Brodie or some such person....

>box?

Huh? That is EXACTLY my set-up (oh, okay, mine was born a "520").
That is a perfect set-up for GCC. Sure, it's not the fastest compiler
on earth, but it produces excellent fast code, and is very ANSI. In fact,
I use GNU C++, which is even SLOWER than GNU C.

>GCC is incredibly resource hungry.

No, 4M is fine for C programs. You can compile the entire NetHack
release with just 4M. Okay, THAT takes a long time, but more memory
wouldn't help significantly.

>It will happily gobble up 8 megs of RAM and then go to work on any
>virtual memory and/or spare disk space lying about during a big
>compile.

This is true on the Sparc, but Sparc code is about three times the size of
680x0 code - for example, the G++ executable on the Sparc is a massive
3.6Megabytes!!!

>While this wouldn't be a real problem if the person was
>only interested in hello.c type programs, I'm assuming that anyone
>going to the trouble to get GCC is probably interested in bigger
>projects.

As I say above, NetHack compiles... thats a BIG project. In fact, I think
the NetHack code has unfortunately large source files. It should be broken
into smaller units.

>I'd be curious to hear how this works out.

Try it out yourself, it's great.

I hope they don't come out with the 1 meg version. It is absolutely
useless unless you upgrade instantly. Can't run MultiTOS, SpeedoGDOS is
very tight... just the screen memory takes a big chunk out of it. If
programmers try to make programs that will run on 1 meg Falcons, it will
seriously hurt the quality of software available. I hope they go the way
of the 256k ST.

Oh, there is one, and I believe only one, use for the 1meg Falcon030.
There is very little to throw away when you upgrade to 14mb. It's the only
way to get a 14mb/0hd config. For those of us who can get _really_ cheap
HD mechs, that *AREN'T* Seagates!

How about free? It was on some STFormat a couple of months ago, I think December. If you can't find a copy where you live, I'll mail it to you. Doesn't come with paper docs, but there's plenty on the disk and I'm pretty sure there's an offer in there to send in and get the physical ones.

3971. Australian ST Sites

Newsgroup: comp.sys.atari.st
Date: 1993-03-12 04:01:50 UTC
From: karlm@mel.dbce.csiro.au
Message-ID: <673@highett.mel.dbce.csiro.au>
Source record: 208707

O.K. I'm sick of having to go overseas for info, sources, soft, and I want to know this: Are there any FTP sites for the lil ol' ST or Atari Range of commputers in AUSTRALIA, or even New Zealand? I have a few B.B.S. numbers, but until I get a decent 9600 modem, I'll stick with the FTP's. Does anyone know of any? I'd even contemplate setting up one ....

Also, does anyone know of a GOOD site where UNCORRUPTED copies of demos can be downloaded from? Atari.archive seems to have a ratio of about 1 in 30 that are good ...

Karl.

I have recently subscribed to GEnie, and have Aladdin software, but I still find it a very confusing place. I am interested in a listing of files that I can browse, is there a way I can get them with out spending 30 min to 3 days downloading them one by one from each library...I would appreciate someone who is experienced on the service to help me along. I don't even know where to ask for help on GEnie...

Yours truly dumb(founded),

Andrew

We might not have the groovy ADA hardware now but dont you think some
company may release one ???? People were slagginf of the 500 since the ST had a
midi interface and the miggy didnt, what these people didnt realise was that a
midi interface could be purchased seperately if thet required the use of one,
and a lot of people did buy a midi interface.
If you want a PC get a PC see if most of the amiga popelation care.

I thought one of the points was that the projected price for Jaguar *WAS*
cheaper than the 3DO. Also I haven't seen a projected release date for 3DO
but I have for the Jaguar.

Anyway, does it matter??

Yes, 6.0.5 is the last recommended OS. Some people however use the 6.0.7 or
6.0.8 and they seem to have no real problems with them.
> And do you have to pay for the udated operating
> systems?
If you talk about Mac OS7, I think you have to pay for that nowdays (I'm
not entirely sure though). Anyway it will not run on the Spectre v3.0
>And if anyone knows, when is a TT compatible version coming out?
We are all waiting on that one, nobody seems to know. Rumour sais: SOON???
But we have heard that a long time.

3982. Fractals

Newsgroup: comp.sys.atari.st
Date: 1993-03-12 11:48:28 UTC
From: d92jk@efd.lth.se
Message-ID: <1993Mar12.114828.2650@lth.se>
Source record: 208719

Another Fractal Creator

I've made a fractal creation program called 'a Fractal Journey into Outer Space' which I've uploaded to atari archive. The program is quite fast (a couple of seconds for a standard Mandelbrot). It's written in assembler and supports real time scrolling and animation. You may also create 16-million colour pictures (.RAW) for use with Photochrome. The file is called fracjrny.lzh and put in in 'New' a couple of days ago.

Have a pleasant day.

3983. Stacker for ST

Sorry to be asking again...

Does anyone have a version (any version! I don't care how beta it is!)
of the "elm" newsreader (or "pine" or any of those other feature-full
unix newsreaders) compiled for use with Hermes UUCP?

One of the sites upstream from me is losing mail, and the solution is to
send it again... Unfortunately, GUS doesn't have the ability to save
outgoing mail, so I can't send it again. :-(

BTW, anyone who should've gotten email from me recently (I think the
mail I sent to Craig Graham and a couple of other people got lost),
sorry! I'm not ignoring you...

From: e8839@titan.hts.hsa.nl
Message-ID: <1714@titan.hts.hsa.nl>
Source record: 208723

We want to use one TT to create a multi-user environment, so several
users can practice assembly programming. The users are connected with
a terminal to a serial-output of the TT, so all the in- and output
must be redirected to the correct user (terminal).
Maybe this is possible using MiNT, because we only use text-oriented
programs.
Is there anyone who has an idea to establish this ?

Spectre does not come with Apple system software, you have to round that up for yourself (along with a couple of Mac ROMs). Up until version 7.0, the Mac System/Finder software was free and available from Apple dealers, User Groups, Bulletin Boards, etc. You should use the version of System 6.0.x software that the Spectre manual recommends (maybe other Spectre owners here could give you the best version to use). And as I understand it, the GCR is compatible with the TT already, just not the built-in hard drive.

Message-ID: <1993Mar12.160735.29079@cs.ruu.nl>
Source record: 208731

In several articles, darrenk@gpu.utcc.utoronto.ca (darren king), and hutch@bellman.lanl.gov (John "HUTCH" Hutchinson) write about the difference between Macintosh systems.
This makes me wonder if anyone could post a list of systems, comparing processor type, clock frequency, data path width, cache size and coprocessor installed/optional/impossible.
Preferably of Macintosh systems, but since this is comp.sys.ATARI.st, it would be nice if the Atari ST/TT/Mega/Falcon, and the (yuck!) Amiga systems would be included.
It would make things a lot clearer for me, as well as some others, I suppose.

3995. Cheap 19in monitor for TT

Newsgroup: comp.sys.atari.st
Date: 1993-03-12 16:24:03 UTC
From: apalmer@pyrps5.eng.pyramid.com
Message-ID: <185725@pyramid.pyramid.com>
Source record: 208732

I purchased my TT when they first came out. I have 4meg ST and 4meg TT ram. I purchased it with the Atari PTC1426. I have wanted the large screen mono, but the price has been too high. This week I was in B&C Computervisions and they are selling 19in Momiterm monitors with a cable for the TT for $495. I purchased one and I'm very happy with it. I'm using it right now. I'll use 1426 on the Falcon I'm buying next month. :']

I have been shopping at B&C for about 10 years. They are located at 2730 Scott Boulevard, Santa Clara, CA 95050. Their phone number is 408-986-9960.

When I purchased my TT, a 40mhz 386dx with the same drives and memory cost the same price. At the time, I thought about buying the 386. I'm glad I choose the TT. Most of my old software worked on the TT and now I'm careful to test software before I buy. There is far more software available for the TT that I would like to own than I can afford. Unless I hit the lotto.

The best news is my TT is worth more than two times the value of the used 386 now.

GEnie can be confusing. If you are using STAladdin v1.5 what you need to do is first configure RTs. Once you have picked that menu you click on add at the bottom and then click on the area which says page number. This will give you a 'product list' of Areas on GEnie. The simplest thing to do is just type M 1000;1 at a main GEnie prompt which will take you to the STAladdin RoundTable area. Its part of GEnie *Basic services and won't acrue any hourly charges. That's the place for help. Also put the GEnieus RT (GEnie User RT) on your list. It has lots of help for beginners.

Don't get discouraged, we were all beginners in the beginning. Send me E-mail by just typing SEND at any main prompt at the address D.FLORY if you're still having trouble. I'll see that you get the help you need. Once you get over the first hump, Aladdin will be your best friend.

Entirely possible, but the question remains, WHY? Why not just have switchable
circuitry that could read the CD for program data and then switch over and
redirect the "audio" data out to a D-to-A converter and amplifier for the
sound?

The limit is 32768 logical sectors. With 512 bytes/sector, you get 16 MB.
BGM partitions (bigger logical sectors) have a size limit of 256 MB.

From: Pandemonium <dhbutler@magnus.acs.ohio-state.edu>
Message-ID: <9303121934.AA01291@photon.magnus.acs.ohio-state.edu>
Source record: 208738

I've recently downloaded Ghostscript, and find that it works fine, but I have a problem. Ghostscript expects to be on drive F. For a program as good as this one seems to be you would think they would write it to check *which drive* it executes from and use that, but nooooo! Anyway, drive F is not at all a good place for me to have this, and I want to know how to permanently set it to another drive, so if anyone knows Pleeeeeaaaaseee help!

I use monitor with above normal ST resolution, and I can't find any sort of GDOS product that will geive more more than a little 640*400 corner, which screws everything up. I even tried the brand *new* FontGDOS direct from Atari, and *surprise* it does not work either (what a shock). If anyone knows of anything I can do please let me know!

Oh, I rarely have time to read this newsgroup anymore, so if you could e-mail back to me in addition to posting it would be nice.

Thanks!

Ahhh.. one correction: the Nintendo's market share has been dropping hard for while. The Sega Genesis is praticatly unstopable. Nintendo had the SNES developed and done in 1988 and now their suffering for sitting on it so long.

But hopefully Atari will come out with a system where they could be a good second.

I am entertaining offers on a complete Magic Sac Macintosh emulator
for the Atari ST. It is in very good shape, works fine and includes the
Apple ROMs, an EpStart utility with the Mac System, the Magic Sac Atari
utilities ver 5.9, the Mac software for moving floppies between a Mac and
the ST via a serial cable, the serial cable itself, and all documentation.

Thanks.

>who is experienced on the service to help me along. I don't even know where
>to ask for help on GEnie...

No, you are not dense at all, Andrew. Info Services like GEnie and CIS are
always confusing at first (although GEnie is _much_ less so than CIS, IMHO).

Since you are using the Aladdin software (smart move) I believe you can use
it to automatically obtain a listing of new files. I don't have it in
front of me but it's an option in the right-most drop down menu, I believe.

Otherwise, you can just log on to GEnie and move to the Atari ST RoundTable
Library area with the command m475;3 (that's short for move to page 475,
section 3). Once there you will see a menu of options. Number 8, I believe,
is "Set Library." Choosing it allows you to move to the files library of
interest... games, utilities, graphics, etc. The default library is ALL.
So select the library category of interest (or just stay where you are)
and choose the menu option "Directory of Files." It will ask you a
couple of questions like "beginning from what file #" and "how far back"
but just press RETURN and it will then spit out a listing of all the files
in that library in reverse numerical (GEnie file number) order. If you
want to capture this info to a disk file, then select the "Start File
Capture" option from Aladdin's rightmost drop down menu _before_ you tell
GENie to give you the directory listing. Once the listing is finished,
then go back to Aladdin and tell it to "Stop File Capture."

If you want a detailed description of the files, then you have to choose
GEnie's "Browse Files" menu option which describes each file in the
library one at a time, pausing between each one to let you read the
description and decide to download it or skip to the next one or quit.

You can download the GEnie User's Manual right from page 1, I believe, as
a free download. Having the manual will make things much easier for you.
You can also purchase the printed manual by calling them. There is a
menu option in each major area for sending mail to a GEnie Sysop for help.
GEnie has a user support voice line which you can call during business
hours if you get _really_ stuck. But that takes all the fun out of it! :)

If you have other questions, contact me by email and we'll go from there.

4009. Atari and Amiga wars. Time for a truce.

Newsgroup: comp.sys.atari.st
Date: 1993-03-12 22:28:26 UTC
From: neurom@aziraphale.u.washington.edu
Message-ID: <1nr2qaINNa3b@shelley.u.washington.edu>
Source record: 208741
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.advocacy

Okay, people. I known this is going to come to a shock to almost everyone who reads this, but I believe it is time (finally) for Atari and Amiga users to call a truce. For the past 5+ years, we've been yelling and screaming at each other about whose machine was better. Now, if you totaled every Atari _and_ Amiga computer on the market, it would barely scratch the surface of say (gasp!) the Mac market. We've been fighting the wrong enemy. It's time for us to say, "Hey, we've got some great computers here. Sure, they're different, and each one is better than the other in some respects. But, nobody else thinks are computers are worth shit. Let's show _them_ that _they're_ the ones who've been missing out."

We've lost too much ground, people. I've heard too many Mac owners laugh at Atari _and_ Amiga owners alike. They don't even consider them worth mentioning! It's time to realize that Atari and Commodore are in the same boat. They both have a niche in the professional arena (Music/Graphics respectively), but in the home market they aren't taken seriously. Both Atari and CBM's stock is plummeting, while Intel and Apple's stocks are soaring. Let's get it together, and realize who the real "enemy" is.

--Neuromancer

[The above, is of course, IMHO. Flames at me will be ignored. Flames with me will be appreciated.]

Doesn't Data Diet do this? It was commercial software from DublClick but
someone else was supposed to pick up distribution for it.

I've never seen Data Diet but I must admit, Stacker is very impressive!
I installed it on my pc's 340Mb drive and bingo... 600Mb available and I
cannot notice _any_ slowdown in how fast programs load from the HD. The
best thing is that it is totally transparent to the user. The Atari
community definitely needs something like this for the Falcon!

What's the Jaguar projected date? 3DO is Jan '94 I think I read somewhere.

From where you got this information? Last time I checked out,
Nintendo increased their market share (Sega had before 80% of the 16-bit
market, last time I checked out, and from a Sega representative article
no less- they had 60%).

DJPEG is the best... What program are your JPEG files being created by?
Several of the ones that create other-than-JFIF files are brain-damaged
due to improperly implementing the spec, others are brain-damaged to
bring in more $$$ for the company (ie, "You can only load our JPEG files
into our editor! HA!")...

GEM-View can also load JPEG files; it's available on
atari.archive.umich.edu... I have no idea of how forgiving it is on mutant
JPEG files.

> just a personal gut feeling.

Ah, but Atari's hardware/hardware doesn't support enough of the SCSI
command set to put a CD-ROM on the ACSI port (via the host adapter)....
So, unless you have a TT or Falcon, and want to use a CD-ROM, you have
to use ICD's host.

Neuromancer: I agree completely. You may find this hard to believe, but once I bought my IBM clone, and went looking for a second system, I chose the Atari STe over a Mac in part because I'm sick of living in a world of one color: blue. IBM is the only game in town, with Apple a distant second. This is sad- I can remember when there were 4 major platforms to choose from. I'd still like to get a mac, but I still have ethical problems with the way they do business. Long live difference!

4022. need to replace A: drive

Newsgroup: comp.sys.atari.st
Date: 1993-03-13 03:31:21 UTC
From: kgg@mv.mv.com
Message-ID: <1993Mar13.033121.8118@mv.mv.com>
Source record: 208853

When I first got my 1040 ST several years ago, my built-in floppy drive,
drive A:, worked just fine.

Over time, it got picky about what I fed it, and started making a dry
little shrieking noise when reading or writing unless it was using a
Sony diskette. (Functionally okay, just annoying.)

In the past couple of months, it has gotten so that it now makes this
sound even with Sony diskettes. Still functionally okay -- i.e. reads
and writes accurately -- but I'm beginning to get worried.

Does this problem sound familiar to anyone?
Is the drive indeed headed for real failure?
How hard would it be to replace the drive?
(I'm mechanically adroit, just ignorant.)
How expensive would it be to replace the drive?
Would it be possible to upgrade to a 1.44Mb drive,
without having to change ROMs or software?
Would it be possible to upgrade to a 1.44Mb drive,
if I *do* change ROMs or software?
It would be nice to be able to actually store 1.44Mb;
however, it would be an improvement just to be able to put a 1.44Mb
diskette in the drive and only use half of it,
just so long as the OS doesn't complain about it.

Thanks,
-- Kenn Goutal

>must be redirected to the correct user (terminal).
>Maybe this is possible using MiNT, because we only use text-oriented
>programs.
>Is there anyone who has an idea to establish this ?

I've tried to do this also, but could not find a proper way.
Finaly I wrote a little program which dups stdin and stdout to the
seriel port, and executes a shell. It is a simple solution, but it
works for me.

I don't know whether programs maybe posted in _this_ newsgroup so I
won't do it. If your interested in this program, please let me know
and I mail it to you.

If you happen to find out more about a multi-user environment outside
this newsgroup, can you please write it?

Hartelijke groeten,

Jeroen.

I think Data Diet 2 should be out soon if it's not out already. I'm a beta-tester. Keith Gerdes of Trace Technologies has picked it up; he was the original programmer of it. Just from what I've heard about Stacker installation, removal, speed, and ease of use, Data Diet is so much better.

Moreover, Keith has a program called Data Rescue, which enables you to very easily recover deleted files. You can have Data Rescue move deleted files to a folder or have it store critical file info in a data file. You can configure these options separately for each partition.

A friend of mine has a cable which plugs into the mouse port of his ST, and splits into two recepticles which you can plus a joystick and a mouse into. Sadly, he is not aware of any current source for this cable, and I was wondering if anyone here knew of a possible source?

4034. Re: Jaguar vs. the 3DO (was Re: Atari Jaguar)

Cross-posted to: comp.sys.atari.st,rec.games.video,alt.games.lynx

I haven't checked into this group for a while. And when I do check back I see t
ons of posts about Jaguar vs. 3DO. I will admit now that I have NEVER seen a Ja
guar and, to be honest, I don't think I'll ever seen one. I haven't even seen a
Falcon yet. But I have seen a 3DO machine from Panasonic, so I do know that th
at can do.

I think a lot of people are putting too much emphasis on the 3DO as a game mach
ine. 3DO and others did not really emphasize gaming as the main thrust of this
machine. They see it as a combination video player, educational tool and entert
ainment machine. True, games will probably make up most of the initial software
. At least until other functions can be thought up or made popular. What I was
really interested in was that the 3DO machine had a video input. The demo set u
p was one in which a live feed from a video camera was processed and displayed
on screen in real time. I don't know if Jaguar has this kind of power and, from
what I've read, I don't think it does. The camera was pointed at the audience
watching the demo. The resulting shot was first wrapped onto a sphere. Then the
video image was put in a little window on the screen and bounced around with t
he 3DO symbols. Another demo was the image was twisted and inverted back and fo
rth repeatedly. Finally, the image was made duplicated 3 times and mapped to th
e 3 visible sides of a floating cube. Finally and most impressive of all, was t
hat all four of these effects were done simultaneously by splitting the TV scre
en into 4 sections. Also, they didn't digitize a picture of the audience and do
these effects. They actually panned the camera while these effects were being
displayed and the picture in these effects reflected the camera panning. There
was no flickering or slowdown. That was impressive. If the 3DO machine came wit
h video-outs, then this will be one cheap home video processor. I mean, add a S
CSI port and you have a cheap digitizer for most machines. One that can digitiz
e full screen motion in real time.

As further demo of the machines ability, they played a short clip from BackDra
ft. It may be possible to put out music video disks this way for about $20. The
disks come with CD quality sound of course.

Finally, the 3DO consortium has many, many powerful (and rich!) partners. I don
't think Atari will be able to overcome this. Matsushita, AT&T-These two alone
(actually Matsushita alone) could probably use their 3DO machine and crush the
Jaguar. The market place has shown again and again that you don't need to have
the superior product to win, you just need to have the marketing clout and enou
gh money to back it up. VHS vs. Beta-VHS won because it had more backers and th
ey were richer. Sega vs. Nintendo-Sega is only staying ahead because they keep
coming out with new products. Yet Nintendo is bigger and sells more because the
y have more marketing muscle and money. Anybody vs. Atari-I like my Lynx, but I
have to wonder about Atari's future here in the States. Game Boy and even Game
Gear are outselling Atari in terms of hardware and software. I think you get

my point.

Fuck! My mailer cut off the top 10 lines! (Or else I just don't know how to use it.)
Anyway, the games are

Final Fantasy II (w/ no box, but instructions)
Zelda III
John Madden Football '92

This had better work.

4040. need help building toswin

Newsgroup: comp.sys.atari.st
Date: 1993-03-13 23:07:52 UTC
From: michaelk@titan.ucs.umass.edu
Message-ID: <1ntpg8INN2ao@titan.ucs.umass.edu>
Source record: 208876
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,
I've been trying to compile the toswin sources on atari.archive,
and while I can get it to work as a .prg, when I rename it to an .acc,
I get a bus error trying to load it, and I have to reboot.
I'm using gcc 2.3.1, gnumake 3.58, gemlib 23, include and library 85,
compiling under tcsh in mint 0.94. When I look at the output from the
make, I get two warnings:

```
In file included from toswin.c:22:
twproto.h:88: warning: type mismatch with previous external decl
g:\\gnu\\include\\minimal.h:66: warning: previous external decl of `main'
```

and

```
event.c: In function `evnt_loop':
event.c:177: warning: type mismatch in implicit declaration for built-in function `strlen'
```

I've removed all of the CFLAGS except -mshort (used to be -mshort
-G -O2 -Wall -fomit-frame-pointer, which would just give me more warnings).
Anybody run into problems with this before? Recommendations?

Thanks for any info,

Michael Kieras

If a Macintosh is a "pregnant calaculator", then an Amiga is an abacus.
Face it, Commodore has not produced any decent hardware since the A3000.
Hardware wise, the A4000 sucks. For the same price as an A4000, a Macintosh
Centris gives you three times the non-interlaced resolution (1182x852 vs.
724x482), EtherNet, better RAM expandability, a CPU that is just as fast if
not faster (The A4000 memory system is VERY ineffecient), a SCSI interface,
more flexibility in being able to use inexpensive SVGA monitors, CD-ROM
support, and so on.

You think the A4000/030 is going to do anything? For $300 less than an
A4000/030, you can get a Macintosh LCIII with a faster CPU (full 68030 CPU
with a 32-bit bus, and not the crippled EC030 that the A4000/030 uses), better
non-interlaced resolution (850x650 vs 724x482 for the A4000/030), better RAM
expandability, and a SCSI interface.

Face it, hardware-wise, Amigas **SUCK**.

Interesting tag line. =^)
Anyway, the number of colors the human eye can see is important.
Medical X-rays are sent as 12 bit grey scale images and a small
company called Silicon Graphics determined that for a monitor to
deispaly colors to the human eye properly, you'd need a 36 bit
RGB signal. That doesn't invalidate the fact that the human eye
sees 8 million to 10 million colors, I just means that you need
a 24 bit to 36 bit conversion table for the ADCs.

This is probably true in the U.S., but here in the UK, the Amiga has a very large slice of the home computer market. The Atari ST/Falcon is not anywhere to be seen (yet...). It IS however beginning to lose out, at one end to the consoles (yuk!) and at the other to the cheap PCs. It is perhaps to early to tell whether the 1200 has gone any way towards sorting out this problem. (And if -MB- reads this, remember: the A1200 may not be suited to what you want, what you think the US wants or what the US ACTUALLY wants, but IMHO it IS what is needed to keep the Amiga alive in the UK).

Robert Brown.

4048. Data Diet info

Since a lot of people are asking me about how to contact Keith Gerdes of Trace Technologies about his Data Diet 2.0 product, I thought I'd better post some information here.

He's almost got an Internet connection, but for the time being, you can reach him at:

Trace Technologies
P.O. Box 711403
Houston, TX 77271-1403
(713) 771-8332 [weekdays 1pm-5pm CT]

Actually, to correct a comment I made earlier, I'm pretty sure Data Diet 2.0 has been out for a while. I have Serial #00003 and the postmark on the envelope is December 29, 1992. :^)

I think, POVRay is one of the best raytracers available for computers. Mostly
you get a packed file with C-Spurces for IBM, ATARI, MAC and Amiga. You can
compile it with Pure C. It runs very well. Although on a FALCON (i render pics
since i bought my FALCON in Dec 92) and although with MiNT.

regards, Jimmy

4051. rz, sz, xyz problems.... Sparc to ST transfer flaky...

Newsgroup: comp.sys.atari.st
Date: 1993-03-14 09:46:26 UTC
From: remyh@cco.caltech.edu
Message-ID: <1nuutiINNjoi@gap.caltech.edu>
Source record: 208895

Here's my setup... I'm running Kaos Tos 1.4 with Serial Fix 2.0 to take care of the RTS/CTS bug, on a 2.5meg 1040st. I'm using Uniterm, and attempting every zmodem program I can find. Oh yeah, I'm using an Intel 14.4k Ext. at 14.4k.

Here's my problem: When I run sz from the unix end, I can receive an ASCII transfer just fine. When I try to send a binary file, all I get are 'zmodem subpacket too big' errors. I've tried the -e flag to remove control chars, and have everything set to RTS/CTS, but it's still not working.
Any clues?

As for Xyz, every version that I've tried to use either crashes immediately, or gives a 'File function error: Cannot open file'.
I've tried 2.02B, gemxyz, xyzshell, and one other.

Any clues as to what's going on here??

Tired of 45% throughput with Kermit,

Remy

4052. Problems installing MiNT

Newsgroup: comp.sys.atari.st
Date: 1993-03-14 09:51:36 UTC
From: remyh@cco.caltech.edu
Message-ID: <1nuv78INNjon@gap.caltech.edu>
Source record: 208894

I'm trying to install MiNT on my F drive. It's a 32 meg, BGM partition, I'm running KAOS Tos 1.4 on a 2.5 meg 1040ST.

First, a question, if I set up the drive as Minix, rather than Tos, how difficult will it be to transfer files between the two?

I've been using the 0.95 distribution, the one that comes on 9 disks. I un'zooed each file to a floppy (am I also supposed to manually unzoo the programs on the disks themselves (not disk?.zoo, but what's inside)). I run setup several times, as the docs say, and it crashes right after it finishes writing one of the 'mint.cnf' files or one of those, to the c drive. The program locks up, displays all the menus, and I have to reboot. Is this normal behavior for setup? If not, any suggestions on how to circumvent it? Any help is greatly appreciated.

bcf@sactoh0.sac.ca.us (Bruce C. Fairbanks) writes:

> What is Ghostscript? Can someone tell me what it does?

Ghostscript is a program (generally on *NIX machines, though available for many platforms) that allows one to preview a Postscript (.ps) file to the screen, rather than print it out.

As far as I know such a tool comes along with LHARC.
It is called PFX_PAK.PRG and works like you want it to do.

Source record: 208887

>Is there anyone who has an idea to establish this ?
Did you already check MIDI-COM.ACC? It's a lowcost network-software working on MIDI-IN/OUT. The actual version should be able to connect up to 7 (or even 32?) ST/TTs in a ring-net. Each terminal has read-/write-access to the drives of the other ST/TTs, if you configure MIDI-COM that way.

So long, Ulf

g>I am trying to get some information on Ray-Tracers for the
g>Falcon/030. Is there anything currently available? and is
g>there anything currently under production. If anyone has
g>any details the name of any software and where I can get
g>some information on it would be great.

Yes, there is a raytracer. It's a package of 3 or 4 programs. It's from the
american firm Lexicor-Software. The name of that package is PHASE 4. You can
also animate your rendered stuff. I saw it last your at the CEBIT. Looked great
and now it supports the Falcon.
Sorry, I don't know the adress of Lexicor, but some american users can help.

4059. Multi-processing on a standard 68000 ST(e)

Newsgroup: comp.sys.atari.st
Date: 1993-03-14 13:09:47 UTC
From: esuoc@csv.warwick.ac.uk
Message-ID: <1nvaqrlNN1k7@violet.csv.warwick.ac.uk>
Source record: 208899

Hi there,
I've been working on a new window operating system for the ST computers
for 2 years now (not man years!) ... because it needs a better one

Well anyway I've managed to build a complete set of widgets, over-laying
windows, a virtual desktop, etc .... and it's wicked!

I've already written programs with this system (a multi-function disk-analyser,
a natural language preprocessor, etc) .... BUT what I really want to do is
multi-process programs in my windows ...

I've tried using the MFP chip, but no luck; I tried time slicing each process
and it just crashed after switching once for some weird reason; I had saved
the PC and SR.

This is really giving a BIG headache .... can anyone help???

I could send some demos of the work I've done so far if anyone is interested.

You're thinking of GhostView, which is a PostScript preViewer.

GhostScript, on the other hand, is an interpreter of the PostScript language that allows output to a variety of devices (including screen, and many different printers), and which is distinct from the Adobe version in that it is available freely in source form under the GNU Copyleft.

I've printed documents out from my Atari to my DeskJet using GhostScript. It's available from atari.archive.umich.edu in /atari/Gnustuff/Tos/Ghostscript.

It's also intended for *printing* the .ps file; there is support for a variety of printers, though (sigh) I still have trouble printing more than one page to the SLM.

I just got this file from GEnie. I take no responsibilities for any error.
This is strictly for your information and enjoyment. This is not ment for
flames. This is not to be read by the mentally immature. This is a complete
comparison of three fine machines.

Enjoy:

Here is a technical comparison between Atari's new Falcon 030, Commodore's

new Amiga 1200 and Apple's new Performa 400. All of these machines are aimed at

the home computer user in price and power. They each feature their own
Multitasking Graphic User Interface (GUI) operating system, which is not
compatible with MS-DOS. Each of these computers has their own software library.
They are all based on Motorola brand CPU's. You won't find "Intel inside" any of
these machines, unless it's in the form of an emulator board! ;^>

Apple Performa 400 System 7.1-operating system
Symantec Greatworks-integrated word processor,database,
spreadsheet,charting,paint & telecomm program
At Ease-program launcher
Teleware M.Y.O.B.-checkbook & cardfile program
T/Maker Clip Art-business graphics
Various Accessory programs:calculator,alarm clock,games etc.
* (This software package may vary depending on place of purchase)

FINAL NOTES: The Atari & Commodore machines are housed in a single case. They do NOT have detached keyboards. The Atari Falcon is in the same case as it's predecessor the 1040STE, and the Amiga 1200 is in a restyled case similar to the Amiga 500. Also, each of these computers is available without a hard drive for less money. However, models with hard drives were used for comparison purposes.

These configuraions are those as supplied by the manufacturer. Individual dealers may offer other configuration options. The Apple Performa 400 has a separate keyboard, it is in the same case as the MAC LCII(In fact, that's exactly what it is!).
The Atari & Commodore machines can operate at many different screen resolutions and would require a multisync monitor for optimum flexibility. Also, the Commodore Amiga 1200's maximum resolutions are interlaced(i). It's maximum non-interlaced resolution is 640x480. Both the Atari Falcon & Commodore Amiga 1200 will also overscan, giving them more resolution in that mode and making them suitable for Desk Top Video (DTV). The Apple Performa would require an analog VGA type monitor. With additional Video Ram, the Performa can display up

to 32,000 colors maximum.
The data path on the Atari Falcon is listed as 32bits wide with 16 bits used with COMBEL. The COMBEL chip sits between the CPU and the memory chips. The bus from the CPU to the COMBEL chip is 16 bits, however, since there are no

waitstates on this bus, it operates at rates comparable to 32 bits. The bus from the COMBEL to the memory is 32 bits. The data path on the Performa is 32 bits wide, although only 16 are used and the RAM accessed is 16 bits.
The Atari Falcon is the only computer here with a DSP (digital signal processor) chip.

| I think a lot of people are putting too much emphasis on the 3DO as a game
| machine. 3DO and others did not really emphasize gaming as the main thrust
| of this machine. They see it as a combination video player, educational tool
| and entertainment machine.
| True, games will probably make up most of the initial software ...

<stuff deleted...>

From what I've heard, 3DO was meant to be more than a $700 games box. A
high-performance video processor for consumers, something that can work
with various consumer video and audio technologies, mixing different sources
to create effects usually found in commercial organizations.

| Finally, the 3DO consortium has many, many powerful (and rich!) partners.

Very true. The members of the consortium would much rather stake a claim
into a new field rather than slug it out in an already existing, entrenched
one like home computer games. (Sega, Nintendo).

Hey... don't forget 'Cyberdrome-The Hoverjet Simulator.' Although the full version is commercial software, the demo is PD and is fully playable in the two player/two computer mode but you only get part of one mission level to explore. Send an email request for more info on this unique simulation.

Anybody know of a fix for the Modem2 port on TT & Mega STE so that I can use highspeed modems without getting all these transmission errors with Zmodem?

The umich archive has read protection on the files in the NEW directory.
You can look at what files are in there but you can't get them. The
reason for this is, I assume, is that they want to test the programs
for integrity and viruses before they put them out for the general public
to mess around with.

However, you CAN use the Newitems directory. That's where approved files
from New end up in about a week (for the most part).

>the Falcon?

You must remember that you can't just "put" graphics chips of that kind
into a computer. They have to be designed in. For example, could the
Falcon's RAM feed the chip fast enough? Would it allow all the standard
ST modes? VGA? Overscan? Linedoubling? Interlace?

Ahh ha! I rember what the problem here is. If I remember correctly the
major problem with Supra controllers (one of the reasons they really
don't exist anymore) was that they only have the capablitlity of controlling
one SCSI device!

Unless my memory is failing me I belive that's what the problem is.
I also don't think that the Supra can handle a drive as large as 1.2 Gig.

Hope that helps!

: Hardware wise, the A4000 sucks. For the same price as an A4000, a Macintosh
: Centris gives you three times the non-interlaced resolution (1182x852 vs.
: 724x482), EtherNet, better RAM expandability, a CPU that is just as fast if
: not faster (The A4000 memory system is VERY ineffecient), a SCSI interface,
^^
: more flexibility in being able to use inexpensive SVGA monitors, CD-ROM
: support, and so on.

Alright. You're the idiot who started this whole lie, so allow me to
finish it.

There is _NOTHING_ wrong with the A4000's memory system. Using 60ns
page-mode, you get 3-2-2-2 access on page hits, and 6-2-2-2 on page
misses. Faster than on the A3000. The two memory systems are extremely
similar.

As DH told me, and I guessed, the lack of burst support on the A4000's
040 card was a cost issue. It has NOTHING to do with the 4000's memory
architecture. Alright? Are you clear now? Feel like telling the truth
next time? Feel like FINDING OUT the truth next time????

Restricting scan rates to 31.5KHz is a restriction, not a show of
increased flexibility. The Amiga's flaw here exists in the OS's
inability to "turn off" specific modes. That will change.

CD-ROM support? No, you mean CDTV support. CD-ROM support exists. Get
your shit straight.

The Amiga does lack in non-interlaced resolution, but not nearly to the
degree you insist. 1) Options exist that are OS-compatible, wedging
themselves into the display list because functions do not yet exist to
ADD yourself, and 2) there's always the A2024 Hedley. Now, don't give me
the shit about panelled displays, they exist in other systems too. They
ARE a solution, even if they're not YOUR solution. It's time you learned
the difference. Increased resolution exists, but it's not what you
want. However, the fact that it's not what you want does NOT invalidate
its existence.

: Face it, hardware-wise, Amigas **SUCK**.

Check your facts. Until you know what you're talking about, which may be
a while, your opinion means nothing, as it usually does.

It should be faster than an A3000, but it is not as fast as most third-
party '040 cards for the A3000. About half as fast, in fact.

>As DH told me, and I guessed, the lack of burst support on the A4000's
>040 card was a cost issue. It has NOTHING to do with the 4000's memory
>architecture. Alright? Are you clear now? Feel like telling the truth
>next time? Feel like FINDING OUT the truth next time????

Everything is a cost issue. The A4000 lacks many, many features --
SCSI, Ethernet, an effecient memory system, support for burst mode, a high-
resolution non-interlaced display, and so on -- and STILL costs more than
an equivelent Macintosh Centris!! All this would be fine if an A4000/040
was, like, 1/3 the cost of a Mac Centris 650, but it costs MORE!! What ever
happened to Commodore's vaunted price competitiveness? Gone to hell, I guess.

>Restricting scan rates to 31.5KHz is a restriction, not a show of
>increased flexibility. The Amiga's flaw here exists in the OS's
>inability to "turn off" specific modes. That will change.

Sure, it will change. Like we will get SCSI II RSN. SCSI should have
been there in standard hardware, and those vaporware SCSI II cards were
supposed to be available TWO MONTHS AGO.

>CD-ROM support? No, you mean CDTV support. CD-ROM support exists. Get
>your shit straight.

Get yours straight. CD-ROM drives are available from third-parties ONLY,
BUT THERE IS NO SUPPORT FOR THEM!

>The Amiga does lack in non-interlaced resolution, but not nearly to the
>degree you insist. 1) Options exist that are OS-compatible
^^^^^^^

That's the magical word, isn't it? So much is 'optional'. SCSI is
optional. Decent 60Hz non-interlaced resolution is optional. RAM
expandability beyond 18M is optional. Optional, optioinal, optional.
How's about delivering more in standard hardware, for a change? Or cut the
price tag to about 1/3 of what it is now.

>2) there's always the A2024 Hedley.

The standard hardware of a Macintosh Centris gives you greater
non-interlaced resolution with 256 colors out of 16 million than an A2024
gives you with 4 gray scales out of 16.

> Now, don't give me
>the shit about panelled displays, they exist in other systems too. They
>ARE a solution, even if they're not YOUR solution.

Is the A2024 a solution to make an A4000 equivelent with a Mac Centris?
No.

Kevin, I have no intent on just jumping in "'cause I like my Amiga", but
because there are some things here that have not been told. Additions
follows to the table (read the table below). My last concern is:
who compiled this information?

I know, what I meant is that if they 'have the chip' they should
have included it on the Falcon... my guess is that the Jaguar's chip
are not ready... looks logical, since there is no 'roaring' around :-)

: >There is _NOTHING_ wrong with the A4000's memory system. Using 60ns
: >page-mode, you get 3-2-2-2 access on page hits, and 6-2-2-2 on page
: >misses. Faster than on the A3000. The two memory systems are extremely
: >similar.

: It should be faster than an A3000, but it is not as fast as most third-
: party '040 cards for the A3000. About half as fast, in fact.

Eh? The 4000's memory system is FASTER than the 3000's. Period. The
difference MAY come in that when you get a page miss in page ram, it's
6-2-2-2, rather than the SCRAM's steady 4-2-2-2 under the same
environment. REGARDLESS, the 4000's memory system is faster.

Note: The 040 card itself is a TOTALLY SEPARATE ISSUE HERE. The 040
card doesn't support the burst mode. HOWEVER, you could easily put in a
card that did and get full burst mode out of it, with no problems. The
flaws exist ONLY in the (A3040???) card.

: Everything is a cost issue. The A4000 lacks many, many features --
: SCSI, Ethernet, an effecient memory system, support for burst mode, a high-

IDIOT. The memory system is perfectly efficient. Read carefully what I
wrote, and you'll see that. What ISN'T perfectly efficient is the
A4000's 040 card. That's IT. Because other systems could come out that
don't have this fault but would still be considered A4000 systems.

: resolution non-interlaced display, and so on -- and STILL costs more than
: an equivelent Macintosh Centris!! All this would be fine if an A4000/040
: was, like, 1/3 the cost of a Mac Centris 650, but it costs MORE!! What ever
: happened to Commodore's vaunted price competitiveness? Gone to hell, I guess.

I'm not here to discuss your opinions on price competitiveness, or which
is better. I'm here to dispute that many of the things you say are
misworded, misrepresented truths, or flat out lies.

: >Restricting scan rates to 31.5KHz is a restriction, not a show of
: >increased flexibility. The Amiga's flaw here exists in the OS's
: >inability to "turn off" specific modes. That will change.

: Sure, it will change. Like we will get SCSI II RSN. SCSI should have
: been there in standard hardware, and those vaporware SCSI II cards were
: supposed to be available TWO MONTHS AGO.

I'm not here to discuss TIME FRAMES either. The fact is, it WILL change. I didn't say "it has", or "it will within 3 months". Fact is, it may change as soon as they release a 3.x rom upgrade.

: >CD-ROM support? No, you mean CDTV support. CD-ROM support exists. Get
: >your shit straight.

: Get yours straight. CD-ROM drives are available from third-parties ONLY,
: *BUT THERE IS NO SUPPORT FOR THEM!*

Yes there is. Drop in filesystems are perfectly supported by the OS. CDFS is lovely.

: >The Amiga does lack in non-interlaced resolution, but not nearly to the
: >degree you insist. 1) Options exist that are OS-compatible
: ^^^^^^^
: That's the magical word, isn't it? So much is 'optional'. SCSI is
: optional. Decent 60Hz non-interlaced resolution is optional. RAM
: expandability beyond 18M is optional. Optional, optioinal, optional.
: How's about delivering more in standard hardware, for a change? Or cut the
: price tag to about 1/3 of what it is now.

Yes, SCSI is optional, just as it was BEFORE the 3000. Because SCSI isn't a system-wide standard on the Amiga as it is on the Mac, which should have been obvious BEFORE the introduction of the A4000. That says nothing about whether FUTURE systems will have SCSI on the motherboard--they very well may. Again, that has nothing to do with a "standardization" of SCSI on the Amiga.

Decent resolution IS optional, yes. Just as high-resolution boards on IBM systems are. As a philosophical statement, the AGA chipset is meant to hit the average joe in the belt. The average joe isn't going to have the money for a monitor that'll do a decent 1024x1024 display. That's high-end, and it's left to high-end products.

RAM beyond 18M is optional in the sense that you can't put it onto the motherboard. What happens with the Mac? Is it "limitless"? No, not nearly. However, when you DO need ram, you can add it.

: >2) there's always the A2024 Hedley.

: The standard hardware of a Macintosh Centris gives you greater
: non-interlaced resolution with 256 colors out of 16 million than an A2024
: gives you with 4 gray scales out of 16.

I didn't ask for a comparison. Your statement about the nonexistence of high resolutions is at dispute. You are wrong. HOWEVER, once again, you didn't mean what you said, you meant "high-resolution, high-color displays". So, like I said, get your shit straight.

And yes, there are high-end boards that can do exactly as you ask, completely competing with the Centris, and are available. They wedge into the display list.

: Is the A2024 a solution to make an A4000 equivelent with a Mac Centris?
: No.

THERE IS NO SOLUTION TO MAKE AN A4000 EQUIVALENT WITH A MAC CENTRIS.
Why? Because one is an Amiga, and one is a Mac, and that's life. The
A2024 answers your claim that there are no high-resolution solutions. I
wasn't making a comparison, I was telling you that many of the things you
want EXIST. Obviously, the things you SAY you want and the things you
ACTUALLY want are two different things.

You'll make a great marketer.

Your statements are in dispute, and often, as shown here, either
misworded, misrepresented, or lies. Get with it.

Greg

Um, marc, just how much expanded memory can you put on the
motherboard of the Centris? Just wondering...

Oh yeah, and the other thing, how many Amiga users need more
than 18 megs? One advantage the Amiga tends to have over
the Mac is that its programs are smaller and more memory
efficient, with .libraries et al...

> The standard hardware of a Macintosh Centris gives you greater

>No.

Certainly not (unless you get Emplant of course ;-))! If you
want multiple screens at once on the Mac, you need multiple
monitors. Whoops, more $$ going bye-bye...

4087. Modem speeds....

Newsgroup: comp.sys.atari.st
Date: 1993-03-15 05:31:49 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1o14c5INNaco@golem.wcc.govt.nz>
Source record: 208926

Sick of slow modems!? Here's something to make you even sicker.
If you have other baud rates I've forgotten, please feel free to
inform me in Email!

Time taken to down/upload 1000k (1,024,000 bytes/1Megabyte)

BPS Time Taken

300 - 9 hours 28 mins 53 secs
1200 - 2 hours 22 mins 01 secs
1275 - 2 hours 13 mins 52 secs
2400 - 1 hour 11 mins 07 secs
4800 - 35 mins 33 secs
7200 - 23 mins 42 secs
9600 - 17 mins 47 secs
12000 - 14 mins 13 secs
14400 - 11 mins 51 secs
16800 - 10 mins 09 secs
19200 - 08 mins 53 secs
38400 - 04 mins 27 secs
57600 - 02 mins 57 secs
67200 - 02 mins 32 secs
76800 - 02 mins 13 secs

If it's possible, the new Supra 57.6K modems, with 100% 4:1 data compression
efficiency, would be capable of 230400bps! (The phones lines would probably
tell the data to go away at that speed!). At this speed, 1000K would take:/

44 seconds!

Of course, 100% data compression at a level of 4:1 (1024bytes to 256bytes,
aka 25%) would be pretty rare at that speed, unless the file was a very
large pure text file.

All times assume 100% transfer efficiency.
e.g. Most 2400bps modems will only usually get around 232 cps, but
this is calculated using the 100% efficiency, which is 240cps!

>
>Chris
>
>--

Chris there were no faulty parts in the STE, the DMA chip that they used did not like the PCB layout of the STE, so they had to come up with a better chip that did not pick up the logic noise, like buffering etc, Atari tries to do things on the cheap and we all now that does not work...

As the Forbes article stated, ' Cheap did not work..'

I think you have to set some shell variable which indicates where your ps
library is located (whith the init.ps, fonts and the like). I don't remember
its name however.

|
|I use monitor with above normal ST resolution, and I can't find any sort of
|GDOS product that will geive more more than a little 640*400 corner, which
|screws everything up. I even tried the brand *new* FontGDOS direct from Atari,
|and *surprise* it does not work either (what a shock). If anyone knows of
|anything I can do please let me know!

It doesn't use GDOS does it? You need special fonts for ghostscript (*.pfa
or *.psf). You can almost certainly get them from the site where you got
your copy of ghostscript from.

Have you RTFM?

|
|Oh, I rarely have time to read this newsgroup anymore, so if you could e-mail
|back to me in addition to posting it would be nice.
|
|Thanks!

Marc

There are files available for ftp from ftp.actrix.gen.nz, though
I wouldn't recommend accessing them from Australia - the ftp request
goes via the path Australia->USA->New Zealand, so you're better off
accessing a.a

However NZ'rs might like to take a look there.

>another drive, so if anyone knows Pleeeeeaaaaseee help!

The version of Ghostscript I have (2.4.1 I think) *defaults* to expecting
its files in a tree starting at f:\gs (ie f:\gs\fonts etc). To change this,
set up an environment variable, eg
GS_LIB=e:\gs,e:\gs\ps,e:\gs\fonts

It's all in the readme.st file...

Source record: 208934

Hello,
I've been asked about my window system...well I've posted a couple
of GFA BASIC 3 mock up programs to comp.binaries.atari.st.

I've used GFA BASIC to do all my mock ups, ideas on how to implement
such a system...I've written another version of the same system in
C/Assembly and it's even faster!!

There are two .GFA TEST programs ...
o Diskanal.gfa - is a half completed disk analyser
I'll probably finish it off when I've finished
the new window system ; which shouldn't be
long! The Bootsector, Directory editors do work
and some other little stuff......
Play around with it! But be careful!!!
(If you mess up your disks, don't blame me!!)
o Virtual.gfa - demonstrates a large virtual dektop
it doesn't use extra memeory for it's 9 screens!
NOTE: to get to another window just move the
mouse pointer to the edge of the screen.
Very similar to Xwindow's vtwm.

Well these programs are very very old (6 months old) ... The new version
is much better graphically and much faster!; it now has a on-line
hypertext system, icons, sound etc....and it's less that 60k long so
far!!

A company in Norway can now supply Falcon030 4meg/65 machines. Deliverytime is maximum 2 weeks.

Price is NKR. 9950,- ex. vat and delivery, and on waiting-list.
if you want a machine fast, pay NKR. 9650,- ex. vat in advance and get a machine atonce. The company can only get a limited number of machines at a time, because of advance payment.

>Robert Brown.

Ok, the amiga and ST has sold quite a lot of machines in england, but the number is only piss in the atlantic compared to the IBM clones. I agree with Neuromancer completely. Let's start finding the positive things about "the other platform" rather than harrasing it. That doesn't help either machine. So I'll start off first....

The amiga1200 graphics are astonishing, I saw the VIDI 12 for it it's almost like 24 bit for the IBM and at just 99.99. The same pic. quality on the IBM costs 249 plus the machine is more expencive.

Yeah, the all mighty Mac LCIII. The machine who is supposed to
be far superior to the Amiga and the Falcon.

I went to the mac dealer here in my town and tested it out.

Graphics speed must be a forign word for apple. Ok, I tested the machine in
640x480 in 256 color. Nothing else on the desktop than the adobe photoshop
and a directory window. The refresh rate was about as fast as a GIF viewer
on my old ST running at 8 Mhz. Ok the LC III has a lot of real good software
and a good support service, but the hardware compared to the price is not
as good. As for the other machines I can't say much cos I haven't tested it
out yet, but if they have the same graphics arcitecture I don't want it nor
can I afford it. And form what I know system 7.0.1 doesn't use
hardware memory protection so what do you need the MMU for?? (I might be
mistaking here though).

Don't want to flame, it depends which type of ST you have. The instructions
give a list of aout 10 resistors to solder wires to, given by their numbers
on the PCB.

Several of the resistors they listed didn't exist on my machine, not their
fault, it's not them who kept changing the layout of the STs circuit-board :)
and the only guidance the instructions give if this is the case is to send
the machine to them.

> Now obviously my experience says nothing about how good (or otherwise)

> -malc. (a satisfied customer)

I will agree that when you get service out of them it is generally quite
good, the problem I (and from the followups and email this thread has
generated, several others have had) in getting them to do something in many
cases. If my machine hadn't been kept for orders of magnitude more than they
said it would twice, and in both cases the machine being returned only when
I prodded them sufficiently. The case they fitted was one from their own
machines, since they couldn't get a new one, and they did return my machine,
(after 2 weeks not 2 days) and it does work. Well it did, but it's been
crashing all weekend, still I'll check my software before giving them a ring,
and I'm NOT sending it back to them,

There are no 57.6K modems, neither will these ever be possible on a normal
telephone line. The 57.6 is probably meant as a 14.4 Kbps modem with 4:1
data compression.

Also note that 4:1 compression is probably the MAXIMUM you can achieve, but
how much you really get depends on the data.

N O W A Y I definately have to disagree here! Mortal Kombat absolutely
wipes the floor with street fighter II and all its variations. Not just
graphically but also for playability. Just compare the difference in controls.

Also as an aside has anybody noticed how real some of tehcniques look. For
instance have a look at the character Raiden who's tehcniques look very much as
though they come from the Hung Gar system of kung fu (or if not definately
southern China).

4108. Gemulator, does it still exist?

Newsgroup: comp.sys.atari.st
Date: 1993-03-15 14:40:34 UTC
From: rscha@ctp.com
Message-ID: <1993Mar15.144034.5194@ctp.com>
Source record: 208948

Hi,

some time ago there was some talk about a program called GEMulator.
It was a program that emulated a ST on a PC-compatible (Yes, I will
wash my mouth later :)). I think it was written by the same person
that wrote Quick-ST (or some program like that).

Has anyone heard of this program? Is it software only or a combination
of software and hardware. Also, how can I get it?

Thanks,

Richard

I am not usre if this is of any help, but I use Kermit here at the Uni and
it moans about binaries alot so I uuencode the files. I have a uudecoder
at home on my ST so I just transfer them uuencoded so Kermit does not complain
and then uudecode them at home.

I works fine. By the way, I transfer between a Unix system and a PC vis
kermit then read the disks on my STE.

May this be of some help to you.

JR> stacker-type programs for
JR> the IBM comtemptibles.

I have used both programs and Data Diet is the better of the two.

Datadiet has a much better rate of compressing and is also a bit faster.
It's DC Data Diet (from DC) but they're now Codehead I believe...

Sega doesn't stand a chance against the SNES, its games are almost of
arcade quality (especially with the new 3d and accelerator chips).

Atari's Jaguar wouldn't even stand a chance against Sega let alone against
SNES.

Yep, that's correct but it costs $1400 over here and that's a bit too
expensive compared to the PC's you can buy for less than $1000 (486
including a lot of goodies).

4115. the cartridge slot

Newsgroup: comp.sys.atari.st
Date: 1993-03-15 15:17:56 UTC
From: msteve@magnus.acs.ohio-state.edu
Message-ID: <1993Mar15.151756.27257@magnus.acs.ohio-state.edu>
Source record: 208947

This is a list of things that people told me through my adress what
can be found for the ST cartridge slot:

1. RTC (real time clock)
2. Diagnostic Cartridge (from Atari)
3. Some Larger programs use it for Copy-Locking
4. Spectre, the Mac emulator.
5. Deskcart- contained several desk accessories and utilities.
6. Ultra Disk(Polydisk?) -RAM disk up to 4 megs in size.
7. Discovery cartridge- copies diskettes
8. Image Digitizer (both printer and hand scanners)
9. Sound Digitizer
10. VT100 cartridge
11. Hacker Interfaces

thanks to:
Jan Anders Janson, David P. Forrai, RICHARDSON,
Mark Spacek, George Seto

/\
/_\nd now a question.

Is there anyone out there sell any of this stuff and how much?
I am interested in finding some of this stuff:

VT100 cartridge, deskcart or something like it, sound digitizer,
and a ramdisk.

I can't buy this stuff now, but I would just like to know where to find it
how much it will set me back...

4118. Best Budget ST Sequencer?

Newsgroup: comp.sys.atari.st
Date: 1993-03-15 15:42:37 UTC
From: evilandi@vnet.IBM.COM
Message-ID: <19930315.080354.887@almaden.ibm.com>

Cross-posted to: comp.sys.atari.st,comp.music

I am looking to get myself a Yamaha SY35 synth, and already have a 1Mb Atari ST with DS drive and mono monitor. I know very little about MIDI, sequencers or synths, but have a good practical musical knoweldge.

What is the best sequencer for under 100 UK pounds? I am particularly after something which allows me to set up drum rhythms easily, and with which I can create a few phrases of music and then copy and arrange them to fill out a whole song (eg. just play a bass line once, then transpose & copy it for the rest of the piece).

Suggestions, particularly from those who already use a certain package, welcome here or to my mailbox. Thanks.

Andrew Oakley <evilandi@vnet.ibm.com> (or IBM VNET: <9oakley@asicvm1>)

>motherboard of the Centris? Just wondering...

68M on the motherboard of a Macintosh Centris 610, and 132M on the
motherboard of a Macintosh Centris 650. To do the same on an A4000 would
require an expensive, optional memory expansion board.

>Oh yeah, and the other thing, how many Amiga users need more
>than 18 megs? One advantage the Amiga tends to have over
>the Mac is that its programs are smaller and more memory
>efficient, with .libraries et al...

Stupid statement. The fact remains that a Mac Centris icludes much greater
RAM expandability as standard hardware than an A4000 does.

>
>
>

The Faclcon OS is also fully preemptive.

I would also mention that the hi colour modes on the Amiga are HAM modes.
Also, does the price quoted for the MAC include a monitor?

I would say that with the additions that have been made the comparisson is
quite accurate.

>Is there anyone who has an idea to establish this ?

I've tried to do this also, but could not find a proper way.
Finaly I wrote a little program which dups stdin and stdout to the
seriel port, and executes a shell. It is a simple solution, but it
works for me.

I don't know whether programs maybe posted in _this_ newsgroup so I
won't do it. If your interested in this program, please let me know
and I mail it to you.

If you happen to find out more about a multi-user environment outside
this newsgroup, can you please write it?

Hartelijke groeten,

Jeroen.

There allready is such a package available on atari.archive in the
Mint-directory. It is a complete multi-user package with login, passwd
etc. I have been running it successfully on my TT.
If I remember correctly, the name of the package is init.zoo or some
such. If you can't find it, contact me and I'll see if I can locate it.

To pop-up or to pull-down - that is the question.
Well, I agree that for Archimedes users (I'm one in my spare time myself), pop-up menus are more intuitive to use. But X wasn't designed with the Archimedes in mind.
I would generally choose to use a pull-down menu, for the simple reason that it's existence is plain to the user. Computer users (especially those who label themselves professionals) are very bad at reading manuals and other documentation, and consequently will run programs without the foreknowledge that window X has a pop-up menu with options A, B and C. On the other hand, a pull-down menu has a button to advertise itself to the world.
That's MHO, anyway.

>chars, and have everything set to RTS/CTS, but it's still not working.
>Any clues?

This a common (and very annoying) problem.

You probably don't have an 8-bit clean connection to your Unix host.
If you are dialing up to an annex of some kind, you'll have to find the
option to tell it to use binary mode. (Sometimes the "rlogin" option
will assume 8 bits, sometimes you have to say "rlogin -b" or "telnet
-b", "set binary" etc.) You need to ask a local wizard about this.

The other potential problem is that your tty is not set to be 8-bit
clean. Fix this by typing "stty <option>" where option varies from
machine to machine. Typically, <option> is "cs8" or "pass8". On a
Sparc, use "stty cs8."

Problems that occur in only one direction (e.g., only on sends and not
on receives) are often symptomatic of a disparity between your modem's
handhsking settings and your term program's handshaking settings. Make
sure both think it's "hardware RTS/CTS".

Okay, for those of you who _keep_ missing it, check out the cross post. I intentionally posted this to _BOTH_ comp.sys.atari.st *AND* comp.sys.amiga.advocacy. I REALLY wish everybody who doesn't see this would please look from now on.

Also, this:

> Okay, thats also true, now what gave anybody the idea I owned an
> Amoeba??? Echhh! Gimme my 4 meg St anyday, thank you!

defeats the purpose of my entire post. There is _no_more_Amoeba_! We can't fight about this, and the slang is just what's going to cause that. The entire idea of that post was to get the point accross that neither computer, or company, would survive in the home (or, perhaps, any other) market if they keep attacking each other. The Falcon and 1200 can _both_ perform extremely well, espically against the new Macs, but nobody gives them a chance. Our voices are both so small, that we have to work together to get this accross.

Industry "experts" have given Apple four to six years life, before PC sales eclipse Mac sales. As it is, 85% of working processers in existance are 80x86. If this keeps up, and all we do is try and get one up on each other in the Atari-Amiga battles, then we'll never get anywhere in the "big picture."

Oh, just a few more points I'd like to share.
1) I own a 520ST, s/n A1 xxx. I've had it since before the 1040 existed, and I still love it. What ever happened to, "it does everything I need it to do."?
2) My store (which shall remain nameless), has sold nemerous Amiga 2000 and 3000 machines to, guess who, Microsoft. He he.
3) ST:TNG is moving Away from Mac's for special effects, and using Amiga's w/ toasters almost exclusively.
4) When members of a local group (who shall also remain nameless ;)) were asked what computer they used for MIDI work, it was an ST.

The above is true. All the information is available for those who wish to call and ask. However, in assurance that I keep my current employment, PLEASE don't go calling Microsoft to ask about Amigas, I think they may just deny it. I'm not sure, however, they may admit it. (Think we might see /NT for Amiga (?!?!?!?))

Hi There,

1. Can anyone recommend a "threaded netnews reader", which will be able to operate in conjunction with HERMES (Atari UUCP)

2. Can anyone recommend a good "frontend" for HERMES rmail

If you can recommend something, can you point out "ftp" sites and the location of the files.

Answers via email to save on bandwidth, I will summarize if there is any responses

Thanks

Dave

What about Fred Fish? Is that nitpicking or correcting a lie?

> CDTV software is written for a system with a 7Mhz 16-bit CPU, 4096-color
>palette, 1M of total RAM, and a very-low-resolution display. For this reason,
>CDTV titles are totally unacceptable. What is need is *AMIGA* (not CDTV)
>CD-ROM software specifically written for the AGA chipset. No such software is

What is needed is a revamped marketing strategy. CD-ROM software isn't going
to boost Amiga sales. How are people going to buy an Amiga if they don't
even know that anything past the A1000 exists? Guess what my first Amiga
ever was? An A3000 because someone on the net told me about their existence
and I checked one out and liked it better than the Macs and PCs. The last I
had heard of the Amiga before that was when I read an article in A+ magazine
comparing the PC, Amiga, Apple IIgs, Mac, and Atari ST.

When I walk into
software stores I see software on disks, not CD-ROM. Sure, in mail order
catalogs I can find CD-ROM, but I like to be able to walk into a store and
ask questions about the software before I buy. CD-ROM is a secondary
generator of sales, not a primary one. And a primary one is what is needed.
Stuff like marketing and applications in general.

>>Yes, SCSI is optional, just as it was BEFORE the 3000.
>
> It should not have been optional so long, but that's naother story. The
>fact that it is optional again is a major travesty.

Not nearly as major as C='s marketing. C= should not have released their
high-end machine with IDE without having that SCSI II card available as an
option. At the very least, they should have marketed their regular SCSI
card as an option. Not just have it available, but have dealers offer a
configuration with the regular SCSI card plus perhaps a slightly smaller
SCSI hard drive for $100 or so more.

>
>>RAM beyond 18M is optional in the sense that you can't put it onto the

Dude, now you are the one that's nitpicking. 18M RAM on the motherboard is
damn well sufficient.

> You shoudl have realized what I meant. I am doing a direct comparison
>here between A4000s and Centris's. It should be obvious that an A2024

>>completely competing with the Centris, and are available. They wedge
>>into the display list.
>
> And are optional. Read: extra cost. Read: expensive. Also read: still
>not supported by Commodore. Also read: not standard hardware.

Here is where I'll agree. C= has some big problems in the high-end. Even
pricing the A4000 slightly more competitively than the Mac Centris isn't
enough. The difference between the price of the A4000 and the Mac Centris
needs to be on the same level as the difference between the A3000 and the
Mac IIci at the time the A3000 first came out. If that is not possible,
they need the A4000/030 and a cheaper 040 (EC040 or whatever) model out
ASAP. The A4000T ain't gonna be enough.

>> I
>>wasn't making a comparison, I was telling you that many of the things you

>>Your statements are in dispute, and often, as shown here, either
>>misworded, misrepresented, or lies. Get with it.
>
> Your messages are filled with half-truths, backtracks, tangents, attempts
>to change the subject entirely, and so on. You do everything except directly
>answer my statements.

You are guilty of the same, along with poor suggestions. Sure, it would be
nice to have CD-ROM software, floptical standard, SCSI II high-end standard,
1280x1024 @ 72Hz, standard 16-bit sound, standard 24-bit color. But people
aren't going to buy an Amiga until they test drive one (unless they've owned
a previous Amiga) and to test drive one they have to hear about it first.
And to hear about it, it needs to be publicized. I know I'm going off on
a tangent from what you and Greg are arguing about, but your statement of
the A4000 needing CD-ROM support at this point is stupid. Look at the Atari
Falcon. Same problems.. one of the cheapest, if not the cheapest machines

you can get with a DSP standard. CD-ROM software for the Falcon ain't gonna sell it. Atari needs to get the machine some exposure, just like C= needs to do the same. It's a real shame that C= didn't take the chance they had with Babylon 5. The fact that they didn't is an indicator that C='s marketing hasn't changed as much as some have hoped.

Well, I've owned my TT for a while, and really like it. However, there are a few things that just won't run on it. I still have my old 520ST sitting there on my desk, with its single floppy. I'm looking for a cheap HD, it doesn't have to be big at all, maybe 20 or 30 meg, to hold stuff for easy access on my old machine.

Prefer something with ACSI connector or assembled with a good host adapter, 'cause I don't feel like messing around with putting one together.

Price and shipping negotiable.

Thanks,

4137. Improving TT compatibility

Newsgroup: comp.sys.atari.st
Date: 1993-03-15 22:41:05 UTC
From: thaanuj@prism.CS.ORST.EDU
Message-ID: <1o30m1INNdm9@flop.ENGR.ORST.EDU>
Source record: 208822

I haven't had very many compatibility problems, but it sure would be convenient if my TT were a little more compatible with older software.

Turning off the cache and running in ST resolutions will get most things to work that don't ordinarily. It has been suggested to me that I get one of the PD programs that fools the MMU into only using 24 address bits instead of 32. The only one I have found is PMMU.PRG at atari.archive. It gives me four bombs instantly. This is probably because I have 8 meg of TT-RAM installed, as it says right in the docs that this will cause problems.

Does there exist another program besides PMMU.PRG that can do this? Or can I flip a dip switch or something to temporarily disable TT-RAM? I ftp'd a dip switch setting .cpx from atari.archive, but it's in German, which I don't speak.

Any suggestions appreciated.

Thanks,

Craig.Graham@newcastle.ac.uk (Craig Graham) writes:

>I own a Falcon myself, but am astonished that Atari would even consider discontinuing
>the only computer which they can supply consistently...

That's crazy. I think they should just DUMP the STe and get on to building Falcons.
Of course they're hard to come by at the moment (actually, the seem to be a thunder
rolling in from quite close now), but when they are available in number, STe
manufacture will be pointless. Of course, that doesn't mean the STe has no support,
since developers will often want to make their software work on the full range of
computers.

>This is ridiculous. There is NO Falcon software on the shelves. There are NO Falcons
>in the shops. With the STE out of production, this will mean NO ATARI in the shops.
>The name will fade......

The name would fade if the STe was on the shelf. What would you pay for the STe
sitting next to the Falcon in the store? $200? $150?

>Luckily, the 680x0 version of Linux is due soon, so I'm adding a faster processor &
>fast ram board & going UNIX as soon as I can.

This is fine - you'll still be able to run all the REAL APPLICATIONS that are available
under GEM. Not those ugly Gooey attempts under X-windows (or worse, TTY unix!).
Unix is great for s/w development, but for applications? Give me GEM any day.

> Not good, but then the Amiga can animate faster than the Mac.

A very subjective statement. Macintoshes do animation in a way that is intrinically slow. I presume that if Macintoshes used the very-simplistic method of doing animation that Amigas used, they could do it just as fast. Maybe faster, since Macs have faster screen updates in the high-resolution non-interlaced 8-plane modes than Amigas do.

> But no... you have to be all against Amiga stuff, asshole.

Look, asshole, I am not against the Amiga because it is the Amiga. I am against the Amiga because of what it has turned into. Amigas now represent backward-thinking and technical MEDIOCRITY. If the A4000 had been design with 1024x768 non-interlaced resolution with 8 bitplanes, SCSI, better RAM expandability on the motherboard, ethernet as a very inexpensive option, the ability to use an inexpensive SVGA monitor with no problems, faster screen updates in the high-res non-interlaced 8-plane mode, and a faster memory system, then I would support it.

The Macintosh Centris gives you all of this, for a price that is LESS than the A4000 that we are stuck with now. This should not be. Amigas used to have better hardware than equivelently prices Macintoshes, but this is no longer the case. Amigas now cost more than similar Macintosh systems, and have inferior hardware features.

This is not intended as a personal flame, but I keep hearing conflicting
viewpoints on Atari's cheapness. In one case they get blasted for doing
things on the cheap so they can offer 'power without the price' and of
course this did not sell, sooo now they are getting blasted for pricing
the Falcon too high. One may argue that they are still building hardware
on the cheap, but over pricing it - I don't know. Just seems you can't
please everyone so they are doing what they can to find their nitch.
Let's face it, Atari will never be anywhere near as big as the clone world
or the Mac world - I just hope they stay in business so I can continue to
use (and occasionally get new) Atari hardware/software.

Randy

That can only marginally be considered "CD-ROM software". It is really
just a collection of files stuffed on CD-ROM and sold. It does not take
advantage of the unique capabilities of a CD-ROM system. An example of a
package that would is something like an interactive adventure with animation
loaded from the CD-ROM disc synchronized with CD sound played from the CD.

How can you say that? Has it ever been tried? Have any CDTV-style
software ever been written specifically for the Amiga, instead of the CDTV?
The CDTV is a subset of an Amiga, and so CDTV titles don't do well as Amiga
CD-ROM software.

> How are people going to buy an Amiga if they don't

CD-ROM may be a poor suggestion in the light of bad marketing, but I
had assumed it would be accompanied with better marketing. The Amiga's
HAM8 modes are really well-suited for use with CD-ROM, because the frames
don't require as much space as a true-18-bit image. Actively promoted
and supported by CD-ROM software written for the AGA chipset, I think an
Amiga could do well.

4142. Problem with Star NX-1000 and WordPerfect

Newsgroup: comp.sys.atari.st
Date: 1993-03-15 23:46:40 UTC
From: michael.smith@f842.n800.z3.fido.zeta.org.au
Message-ID: <3_800_842_fidonet2ba5088a@Kralizec.fido.zeta.org.au>
Source record: 208825

I'm sure I've read something to do with a problem with a certain revision of the NX-1000's software that may be the cause here, but any information would of great interest!

The problem :

Bolded text printed on the same line as underlined text is noicably blurred
(actually displaced a substantial amount)

Observations :

WP does not use the printer's inbuilt bolding capacity, but rather sends the line of text, then a carriage return and then the text to be bolded...

The fault is reperoducible on the small number of NX-1000's available (4 or
5) for testing, all approximately 3 years of age...

The Question :

Has anyone else encountered this problem, and solved it?

Related Questions :

Am I correct in remembering the PROM problem with the NX-1000? Which prom revision(s) suffered? What is the latest release of the software?

Thanks for any input...

However, those third party cards until recently (due to competition from
the 4000) were all in the $1000+ range. Besides, so what if 3rd parties
make '040 cards faster than the 4000's? Third parties make processor and
video upgrades for the Mac that speed those machines up beyond their native
capabilities. By your logic, that means that (to use your own eloquent
phrasing re:Amiga) THE MAC HARDWARE SUCKS! (lots more !'s deleted).
Gee, you know, I begin to think you may have a point there, Marc :).

> It's all the part of an integrated whole. Whatever the real, underlying

>shipping A4000 systems that benchmark at about half the speed of third-party
>25Mhz 68040 cards for A3000 systems. PERIOD.

Again... so? There are indications that the 4000 is not intended as the
high end of the AGA line. I wouldn't be surprised to see a more powerful unit
shipping by year's end.

>CD-ROM software specifically written for the AGA chipset. No such software is
>available. **NONE** Therefore, CD-ROM on an A4000 has *NO* support.

There is no Mac CD-ROM software optimized for the '040 and written to
poke directly into the Quadra video hardware. Therefore, CD-ROM on the
Quadra has *NO* support.
Not long ago, the amount of commercial software optimized to run on
386 and 486 machines was almost nil. Therefore, the 386 and 486 chips
had *NO* support.
Do these examples sound a bit absurd? Of course they do; they're written
according to your own logic as expressed above.

> It is typical that you would bring up a FILESYSTEM as an example of
>"CD-ROM" support. A filesystem is what allows support to be available, but it
>is not support in its own right.

Let me get this straught... software ad utilities written _specifically_
for use with CD-ROM equipment are not CD-ROM support?
Marc, with that file system and a CD-ROM drive, it's possible to run
much of the software for CDTV, use the data from a wide variety of
collections of clip art, and get the entire Fish collection on a single disk.
Hey, the Fish disks contain AGA compatible programs, so I guess the 4000 does,
after all, directly support CD-ROM, even by your logic!

>>Yes, SCSI is optional, just as it was BEFORE the 3000.
>
> It should not have been optional so long, but that's naother story. The

Brought about by Bill Sydnes, who is now history. Unfortunately the
4000 was already too far along when he left to make the change to SCSI.

In that case, we'll have to discard as non-standard hardware any device
that plugs into a Mac.

Not supported by Commodore? Granted we still don't have RTG, but what
do you think the display databases in 2.0+ are there for?

Marc, you'd still find something to complain about even if CBM built
such a machine and sold it for $19.99 with a 50 year on-site service
warranty.

Atari has, through its "Power without the Price" approach, made clear
that is is seeking what is known is business as the "price leader"
position in the market. This strategy, due to a variety of factors,
has failed, as evidenced by Atari's poor financial performance. Whether
Atari is "cheap" or not really is irrelevant- it needs to abandon the
price leadership objective, as there is little chance that they will be
able to beat out the horde of clone makers in terms of price. Atari ought
to be playing on its strengths- a useable GUI, for one thing. By moving
into the 68030 realm (even at 16MHz) they are setting up things for the
future. As it won't be long before a 68030 is considered entry-level,
they will have a platform to move up from. I'd recommend losing the
STe soon, even though I own one, as it has become seriously outclassed
by technology on other platforms at a comparable price.

Why in the world do you concern yourself with how fast or slow the A4000's
memory system is? Have you not said time and time again that the software
for the Amiga sucks? Do you not realize that no amount of hardware is going
to solve what your personal problems? If you don't like Amiga software, why
in the world are you worried about a system that will only run this software
faster?

>benchmark at about half the speed of third-party 25Mhz 68040 cards for A3000

>systems.

The fact that it can be replaced is in fact highly relevant. It is entirely possible and probable that an A4000-based machine using the A4000 motherboard with 040/DSP/Burst-mode CPU daughterboard, SCSI-II Z3 board, etc. could be introduced in the future. Apple has repackaged their Macs at various times, but maybe you think that they have some sort of patent on doing such things.

As for the A4000 being 1/2 the speed of an 040 board in an A3000, you are quite mistaken. Compared to a PP&S 28MHz board in an A3000, the A4000 comes in at .90x the speed. Simple math shows that this can be attributed to the difference in the clockspeed, but then again I guess such things are beyond your meager intellect.

>>: Everything is a cost issue. The A4000 lacks many, many features --
>>: SCSI, Ethernet, an effecient memory system, support for burst mode, a high-

>
> I am discussing competitivness. You are picking nits.

Marc, C= claims to be selling the AGA machines as fast as they can produce them. If they are producing at their limit, I'd say that they are doing pretty well and that the machines are a success. It is unfortunate that you still cannot see that C= is not Apple, C= has never been Apple, C= will never be Apple, etc. Why don't you take everyone's advice and get yourself a Macintosh and be done with it? Sheesh, are you such an idiot that you'll keep making yourself miserable by using something that you don't like? Do you continue to eat foods that give you the shits and complain about them all the time?

>>: >Restricting scan rates to 31.5KHz is a restriction, not a show of

>CD-ROM software specifically written for the AGA chipset. No such software is
>available. **NONE** Therefore, CD-ROM on an A4000 has *NO* support.

Hmm, it's funny that there are Amiga drivers on the "Majestic Places" series
of CDROMs which don't require a CDTV. The very fact that at leat *ONE* piece
of software provides such support proves that you are once again wrong.

> It is typical that you would bring up a FILESYSTEM as an example of
>"CD-ROM" support. A filesystem is what allows support to be available, but it
>is not support in its own right.

What in the world do you think a CDROM is? It's just another form of
digital storage media, can't you get that through your head? How else
can you explain the fact that CDROMs can be read on a variety of different
systems? Do you think it is some sort of magical new technology that
requires some special wizardry to make it work?

>>: >The Amiga does lack in non-interlaced resolution, but not nearly to the
>>: >degree you insist. 1) Options exist that are OS-compatible

>>: ^^^^^^^
>>: That's the magical word, isn't it? So much is 'optional'. SCSI is
>>: optional. Decent 60Hz non-interlaced resolution is optional. RAM
>>: expandability beyond 18M is optional. Optional, optioinal, optional.
>>: How's about delivering more in standard hardware, for a change? Or cut the
>>: price tag to about 1/3 of what it is now.
>>
>>Yes, SCSI is optional, just as it was BEFORE the 3000.
>
> It should not have been optional so long, but that's naother story. The
>fact that it is optional again is a major travesty.

For you. I just added another hard drive to my A4000, and I got an IDE
drive which is very fast. In fact, the pissant Seagate 233M drive in my
A4000 is as fast as a Quantum 240M in an A3000. The IDE takes up as much
as 50% of the CPU for some operations, but that still leaves it with more
CPU avaiable than the A3000 at rest!

>> Because SCSI
>>isn't a system-wide standard on the Amiga as it is on the Mac, which
>>should have been obvious BEFORE the introduction of the A4000.
>
> It definately should be. Having SCSI as a system-wide standard has solved
>many problems for Apple, most notably in the area of CD-ROM.

What'cha gonna do when the SCSI-II board appears and blows away the Mac
SCSI implementations? Me, I'm gonna buy one, use it, be happy with it,
and sneer in your fucking face...

>> That says
>>nothing about whether FUTURE systems will have SCSI on the
>>motherboard--they very well may. Again, that has nothing to do with a
>>"standardization" of SCSI on the Amiga.
>
> Which is another tangent. The fact remains that an A4000 lacks SCSI, and
>a Mac Centris includes SCSI.

The fact also remains that the Centris lacks a video slot for an OpalVision
board, an IDE adapter for IDE drives, a keylock for protection, a modular
CPU board for easy upgrades, a two button mouse, a true multitasking OS,
a video coprocessor, and 2M video memory. The Centris includes none of
these, and while some are avaialble as options, others cannot be had unless
an Amiga is purchased. I can add Ethernet (already have), SCSI (soon will),
support for more memory (18M is more than I can use at the present), a high
res non-interlaced video board (I may get one), and even a Mac emulator (I
had one, but gave the piece of shit away, I hate those damn things).

>>Decent resolution IS optional, yes. Just as high-resolution boards on
>>IBM systems are. As a philosophical statement, the AGA chipset is meant
>>to hit the average joe in the belt. The average joe isn't going to have
>>the money for a monitor that'll do a decent 1024x1024 display. That's

>
> Why is it "high-end"? It certainly isn't on any other system. Mac
>Centrises with 1182x852 60Hz non-interlaced resolutions cost $2000 street
>prices, and one can easily purchase 486 PC clone systems with resolutions
>of at least 1024x768 non-interlaced for much less still. The fact that these
>resolutions are "high-end" on the Amiga are a demonstration of the Amiga's
>hardware inferiority.

Funny, but none of these Macs or Clones seem to be able to output an NTSC
or PAL compatible signal with a horizontal resolution of greater than 1280
and in >256k colors. The fact that these machines cannot generate such
modes without resorting to expensive hardware is a demonstrations of the
Amiga's hardware superiority.

>>RAM beyond 18M is optional in the sense that you can't put it onto the
>>motherboard. What happens with the Mac? Is it "limitless"? No, not

>>didn't mean what you said, you meant "high-resolution, high-color
>>displays". So, like I said, get your shit straight.
>
> You shoudl have realized what I meant. I am doing a direct comparison
>here between A4000s and Centris's. It should be obvious that an A2024
>would not be sufficient to bring an A4000 up to the level of a less-expensive
>Centris.

You should also realize that there are several areas in which the Centris
is still lackign in comparison to the A4000. Most folks will buy the
machine which offers what they want for the best prices. The Centris is
just flat-out not suitable for certain tasks at which the A4000 excels,
and there are also persons such as myself who just flat-out hate every
fucking Macintosh, no matter what the configuration.

>>And yes, there are high-end boards that can do exactly as you ask,

Yes! I can confirm this now - the *@#$ Supra cannot handle the 1.2 Gb Fujitsu!
I can get it to work only for a while, then it just dies. I'm not too
concerned though, as I will be hooking it up via SCSI-2 to the Falcon. Thanks,
"Zoooks"!

Sorry, Didn't mean to imply I thought it was a bad idea. I quite agree. I'd much rather there was COMPETITION in the computer market. Companies would then be forced to upgrade their machines radically or get left behind my their competitors, unlike the situation which has persisted for the last few years, in which companies have merely tried to make Lotus/Excel/... run a tiny bit faster. (Everyone remember the early 80's? There were a good few flops, but a lot of nice machines appeared, AND WERE IMPROVED... ZX80,ZX81,Spectrum VIC20/C64/C128/..... (can't remember all the other variants)).

The Falcon030 has it's good points and it's bad points, as does the Amiga 1200. Competition between these two, and maybe the Mac (boo! hiss!) would be much nicer than the current mess! Who knows, we might actually see some ORIGINAL IDEAS implemented and maybe some new computers might actually come along!

OOPS! Forgot the Acorn Archimedes. Stick that in to all the above. (US people probably haven't heard of it, but it's sold quite a few over here, and is a reasonably nice machine...)

Robert Brown.

The problem appears to be that Marc Barrett (A constant annoyance to all of us over in comp.sys.amiga.advocacy) seems to have started one of his stupid debates in a thread that was supposed to be of joint interest to ST and Amiga owners. Maybe someone ought to teach him to use his news-reader properly, so that he can change the subject title and cross-posting newsgroups appropriately.

Robert Brown.

The Polydisk Is awesome; Just plug it in before boot up and away you go!
Mine has a built in clock. You can do stuff like boot accesories from the
ram disk. You can unplug it and the battery kiks in so that you can
quickly copy stuff from 1 ST to another (if you have a hard disk)

] Yep, that's correct but it costs $1400 over here and that's a bit too
] expensive compared to the PC's you can buy for less than $1000 (486
] including a lot of goodies).

Remember to add the price of a DSP board and the very latest
Sound-Blaster.

the $1400 modem is the 14meg/65megHD version isn't it!? Which comes
with Speedo-GDOS, Multi-TOS (Windows equiv'), Atari-Works, (MS-Works
equiv'). And all sorts of other goodies. So, it's not to be sneezed
at 8-)

[more stuff deleted :-]

I can't say about only "m" models, but I *did* used to have a 1040STF - it had the built-in floppy, bit NO RF-modulator (i.e. it was the SC1224 for me or nothing :-). I bought it used in 1987 (or 1988), and the previous owner had had it for around 2 years, so it may have been one of the earlier ones. Nice system, but I'm happy I traded up to my MSTE (and got a built-in RF-modulator and everything! :-)

>Anybody know of a fix for the Modem2 port on TT & Mega STE so that I can use
>highspeed modems without getting all these transmission errors with Zmodem?

I have Serial Fix 2.0 installed in my Auto folder (and the accompanying
CPX) and haven't had any problems doing high-speed transfers on my MegaSTe.
To note, I've used a Qblazer 38400 baud modem (at 19200) on modem 2 and serial
2 and doing a null-modem transfer to my PC have gotten around 3000cps.
I use the Connect 1.92 term program for this (since it seems the friendliest
in terms of handling the extra ports, etc)...

Anyways, summary: Serial Fix 2.0...

Well, just when we thought that atari Oz might actually have learnd
something...

the list price for the b are falcon will be AUD$1295 they now say, not the
AUD$999 they were initially quoting. That's the same as the 2M/40M A1200.

The 4M/65M falcon will, they say, be about $1995.

Shit.

Hello,

I'm interested in getting an ST for MIDI sequencing. My nextdoor neighbor has an old 520ST, with single sided drive, and 1 meg. I was wondering if it's worth the effort to upgrade this machine to current specs. or wait and get a Falcon? I'd probably be able to get it for around $150 with the SC1224 monitor. How much more would I have to spend to get the latest TOS, etc. Would this system be capable of handling MIDI work, or would I need more RAM? Any info. would really be appreciated. Thanks!

Does this Marc Barrett own an amiga?? If he does and he don't like them
I know someone who'll take it off his hands so that Marc can buy a really good
computer that he cant slag off.
Anyway whats wrong with the way the amiga has turned out? We have a
cheap machine that can have a hard disk and can run existing amiga software
that challanges the consoles....the one and only A600. We have a machine in
which you can shovel in loads of hardware the 2000. We have a machine that has
got a really fast processor and a really big box to put in really flashy bits
of hardware and its called the A4000. Finaly, we have a nice cheap home
computer that is a natural successor to the old A500 which we shall name the
1200.Dunnno about you, Marc, but the amiga has matured quite well from the days
when it was a A1000.

One other thing, Marc, if there was a new amiga out which had all what
you wanted would you really buy it and be content? Or would you buy it and then
slag it off form being , in your opinion, a load of crap???

|>
|> Doesn't Data Diet do this? It was commercial software from DublClick but
|> someone else was supposed to pick up distribution for it.
|>

I don't know Data Diet, but i had an AUTO-Folder prg which
compressed any partition i selected and it had an control-acc
to change compression rate and exclude some prgs which don't
like compression.
I threw it away because it messed up many thing like PATH (or
maybe other environment strings as well)

There are two SHAREWARE programms AFX (Auto File Extractor) and
SFX. They come with the LHARC-package.

You simply comress the datafiles with lharc (-c I guess it was), put
AFX into the AUTO-Folder and the data will be decompressed while
reading.
It is said to work with almost every program (eg Signum!)

SFX packs binaries, well the packing is done by lharc but SFX makes
them selfextracting.

I prefer this way because i am able to select what to compress
and what to leave long (zoo and lzh).
And i believe it is a little more secure, because one damged file
means one file less, not one partition less (just IMHO)

This might be faster on a slow HD, it IS faster on FD!

Mail T. Quester for more information (or get LHARC)

Axel Kielhorn

I have the following items to sell:

1) Daisy wheel printer (not serial!) all leads acoustic hood and spare ribbons.
2) several games- Atari ST
i) MidwinterII
ii) Supremacy
iii) Rugby - The World Cup
iv) Meglomania/first samurai
v) Storm Master
also have a Logic 3 free steering wheel - never used!
The above games have been used very little or not at all and are in perfect condition. Please ring me and make an offer (I will pay all postage on games and I will arrange a courier service for the printer if need be).
I am willing to trade for other games and atari hardware (monitor etc I might even accept another printer - anything goes!).

Gordon Farrell: No, it didn't last long, and the problem isn't that
ST owners should like other platforms (and vice versa), but that they
should all get off of their high horses and quit bashing each other.
I happen to think that the Mac is a decent platform (no, I don't own one,
nor do I own Apple stock!), but I'd rather support the ST at this time
because I think the world has gotten alot more boring now that only
2 platforms (IBM, Mac) have become the standard. I don't even like Amigas,
but that's not the point: there is no sense is me blasting Amiga
owners for owning a machine which they presumably like. By the
way, Gordon, this is not directed at you, but you made a good point
about how briefly this 'truce' lasted.

Hi!

The vote on creation of comp.sys.atari.advocacy is just 15 days away from completion and if after that time I manage to get it created one of its charter rules was that threads should NOT be cross posted. Anyway I get this funny feeling that this particular one has ended up being more than slightly Amiga orientated anyway.

I've thought of a solution. Whould someone like to start a vote on something like

comp.sys.68000.advocacy or comp.sys.amiga_st.advocacy ????

I think that'd be a very sensible suggestion... more sensible than the separate amiga and atari advocacies I think!!!!

Any ideas?

David.

>require an expensive, optional memory expansion board.

To do this on a Centris requires a real expensive 16MB SIMM and you need to
junk/sell your old smaller SIMMs. I don't think that the Centris has an
advantage there (besides, at least one of the forthcoming SCSI-II controllers
have place for 64MB RAM which reduces any 'board' cost to zero).

> Stupid statement. The fact remains that a Mac Centris icludes much greater
>RAM expandability as standard hardware than an A4000 does.

Incorrect. It supports much greated RAM expandability on the motherboard. But
you may know that RAM expansion is perfectly supported on the _expansion bus_.

Funny, but none of these Amigas seem to be able to output a high resolution (i.e., 1024 x 768 or greater) video signal noninterlaced at a 72 Hz or greater vertical refresh rate regardless of the number of colors. The fact that these machines cannot generate such modes without resorting to expensive hardware is a demonstration of the Macintosh's hardware superiority.

>data compression.

>Also note that 4:1 compression is probably the MAXIMUM you can achieve, but
>how much you really get depends on the data.
>--

yep, no 57.6 kbit/s modems. High speed modems transfer 14.4 kbit/s at 2400
baud using several carriers. That is the physical transfer rate on the
telephone line. By compressing data before being set and decompressing at
the other side, you get get a transfer rate 2 or 3 times higher than
that (I don't believe advertisers saying 4:1). Therefore data transfer
between your computer and modem should be higher than 14.4 kbit/s.
So 57.6 kbit/s is probably the speed on your RS232 cable, not the tel line.

Depends on what you mean by "on the fly". Can I click on a button in dialog box and have the screen change resolution and video timing - sure, it's no problem on a Centris or Quadra machine. Using a multifrequency display I can switch on the fly to a variety of resolutions from 640 x 480 VGA up through 1152 x 870 75 Hz noninterlaced.

4188. ICD program SCSI.PRG site?

Newsgroup: comp.sys.atari.st
Date: 1993-03-16 15:00:10 UTC
From: dick@ahwau.ahold.nl
Message-ID: <C3zLoC.65E@ahwau.ahold.nl>
Source record: 208683

I'm looking for a site (preferrable ftp-site) in Europe who has got the
SCSI.PRG from ICD.

I have tried to get it from the ICD BBS in the US but when i'm connecting
to the BBS i get an V22bis connection. I have myself a V32 modem,
so 9600 baud is preferrable!
The time i get (30 minutes) is not enough (for me) to get the SCSI.PRG (60k).
Has the ICD the possibility to get an faster (V32) connection?
(I phoned +1 815-968-2229)
Is there a European BBS? (I tried Germany +49-(0)610467582 but 'no answer') ?

Anyone ?

Thanks in advance.

>Master B, please enlighten me!

I was comparing hardware features here. The superiority of the Amiga in multitasking is offset by its VERY tiny software base, and the fact that the AmigaOS is not superior overall. The AmigaOS lacks many important features of the Mac OS, especially DIG/RTG, object-oriented drawing tools, and support for font substitution.
>> That's the magical word, isn't it? So much is 'optional'. SCSI is
>> optional. Decent 60Hz non-interlaced resolution is optional. RAM
>
>But Master, isn't that optional on _all_ other computer systems too?
>Or what is _decent_ in this case, GM B? Give me a clue Master!

Well, a Centris can give you 1182x852 non-interlaced with 16 colors with no enhancements whatsoever. Expand it to 1M of VRAM and you get the same resolution with 256 colors.

>But GM, can your average clone (or average Taiwanese Special) have
>hundreds of megabytes of RAM? GM B, where is the limit of usefullness
>and uselessness? Is it 19M or 200 MB?

Most clones nowadays usually have SIMM slots for about 64M of RAM. 32M is usually the minimum you see on most clone motherboards these days. It should not be unreasonable for C- to keep up with the rest of the industry in this regard.

>> How's about delivering more in standard hardware, for a change? Or cut the

Both have their pros and cons, but the Amiga graphics architecture
is in overall superiour. The Mac doesn't have sprites/dualplayfields
and no 256k color modes that can be animated in real time.

To have higher resolutions on the Amiga, C= has to work on increasing
bandwidth, to allow Macs to have sprites, copperlist, etc., Apple would
have to drastically change the way the Macintosh does displays.

Oh? I've seen 16 frames/sec on my 1200... Only 1/4 screen, but on the other hand we're talking real-time texture mapping... Show me a $(current price of A1200) Mac that can do that... Hell, if we're talking anim speed the Amiga can page flip without CPU load... (read: clever Copperlists). 50 fps (PAL)...

|> >Or what is _decent_ in this case, GM B? Give me a clue Master!
|>
|> Well, a Centris can give you 1182x852 non-interlaced with 16 colors with
|> no enhancements whatsoever. Expand it to 1M of VRAM and you get the same
|> resolution with 256 colors.

So the RAM is an option. YOU HAVE TO BUY IT. But listen kid,
the *CENTRIS HAS NO FPU AND THIS IS DAMN IMPORTANT CONSIDERING THE A4000
COMES WITH ONE* WHY YOU DON'T BITCH ABOUT THAT? HAVE YOU CHECKED APPLES
BROCHURE FINALLY?

|>
|> >But GM, can your average clone (or average Taiwanese Special) have
|> >hundreds of megabytes of RAM? GM B, where is the limit of usefullness
|> >and uselessness? Is it 19M or 200 MB?
|>
|> Most clones nowadays usually have SIMM slots for about 64M of RAM. 32M is
|> usually the minimum you see on most clone motherboards these days. It should
|> not be unreasonable for C- to keep up with the rest of the industry in this

|> regard.

BS, if you can upgrade easilly, and then the AMIGA supports FAR MORE
MAXIMUM MEMORY THAN THOSE CLONES, GOT THAT?

|>
|> >> How's about delivering more in standard hardware, for a change? Or cut the
|> >> price tag to about 1/3 of what it is now.
|> >
|> >But GM, the 68040 chip itself costs $400 for Commodore. We don't want
|> >them to go to bankcrupcy or do we, o Master?
|>
|> Then why does the EC030 version of the A4000 cost so much?

1/3 of the price, well , you don't know about anything anyway.

I agree that the A4000 should be lowered in price, as well as the upcoming
A4000/EC030. And yes, they should lower those prices.

But the difference is...

*** YOU ALWAYS BITCH/MOAN AT WHATEVER C= DOES/HAS NO MATTER IF IT IS
GOOD OR BAD AND EVEN WORST ---> YOU USE LIES TO BACK UP YOUR
STATEMENTS ***

Hi,
I've heard MiNT does what I want to do ... but what if I wish to sell my
program commercially??

Can I use MiNT's author's method of process switching and memory protection??

PS. The program I sent to atari.binaries is written in GFA BASIC because
it was easier to work out how a widget and window system works.
The new version is written in Assembly and C for speed...which is much
better than the BASIC version.

Thanks replies! 8*)

Bekemyer makes a Multiuser C shell that we have used at out establishment.
As soon as MultiTOS is released they are going to update it. We have used it
as networking software as well.

Seriously, you can do 320x200xHAM8 (256k color) animations at ~30fps
(with a big delta) no sweat on a stock Amiga 4000. You said "less than
10 frames per sec," were you talking about ANIM7 animations or MPEG?

I would love to see how many fps can a Centris 650 pulls off from a
MPEG animation file without nifty MPEG card.

Yes there were STf and STm's. I have one of both. They are just
respectively 'f' for floppy mainly early 1040's and 'm' for modulator this was
one of the early 520's.

Hope that helps,

Dan

Apple has an FTP site where you can get the 6.x versions of the OS. They
come in a funky disk compaction format used only by Mac's (as far as I know),
so you will also need the program to extract them. Talk to the folks on one
of the Mac newsgroups and they'll be able to tell you exactly where to go.
They've been very helpful to me in the past.

4205. Neodesk 3.03 problems

Newsgroup: comp.sys.atari.st
Date: 1993-03-16 18:42:29 UTC
From: ultron@csd4.csd.uwm.edu
Message-ID: <1o572lINNo50@uwm.edu>
Source record: 208790

I can not get the latest version of Neodesk (3.03) to run off of the hard disk of my computer system. It will run off of the floppy disk. I had no problems with version 3.02. I get the same results using the 3.03 disks I created with the Neodesk patch file, and with the Neodesk 3.03 files I had shipped from Gribnif (for $7).

Here is the error I get when I try to execute Neodesk from my hard disk, followed by the register dump from pressing 'R'.

A Bus error has occurred (2 bombs).

>comp.sys.amiga.graphics indicate performance of less than 10 frames/sec.)

Here are a few that I tried :

320x200x8, HAM8, 30 frames, plays 8 times in 5 seconds, 48fps
192x288x6, HAM6, 79 frames, plays 5 times in 5 seconds, 79fps
640x400x3, 8 color, 152 frames, plays 2 times in 5 seconds, 60fps
352x240x5, 32 color, 91 frames, plays 4 times in 5 seconds, 72fps
352x440x6, HAM6, 72 frames, plays 4 times in 5 seconds, 56fps
320x200x6, HAM6, 75 frames, plays 8 times in 5 seconds, 120fps
320x200x8, HAM8, 58 frames, plays 4 times in 5 seconds, 46fps
352x220x6, HAM6, 42 frames, plays 10 times in 5 seconds, 84fps
320x200x4, 16 color, 94 frames, plays 6 times in 5 seconds, 112fps

All were displayed on a Super72 SuperHires Laced screen, which sucks as
much bandwidth as possible.

First, I want to state that the above was in reply to Marc Barret and
no one else. That's why the style.

|>
|> Well, I'm not a little kid, and I can't show you 256K color animations,
|> but I'd be happy to show you 32K or 16 million color animations that run
|> just fine on my Mac, thank you. Tell me what animation resolution you're
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
| Unless you buy $$$extra hardware$$$$ this is not true. I was
at the last summer CES were Apple themselves were showing Quicktime
using a QUADRA on 160x120 and just resizing it a bit was slow.
This is just 256 colors.

I have seen 256 color 320x120 (or about 120) *from the IDE hardisk*
in 20 fps+. This is one of C='s demos.

|> using, what practical frame rates you can acheive, and what the average
|> frame delta is and I'll be happy to match or exceed it. We're talking

Cross-posted to: comp.sys.atari.st,comp.sys.amiga.advocacy

barrett@iastate.edu (Marc N. Barrett) spews:
[I am against the Amiga because of what it has turned into. Amigas now
[represent backward-thinking and technical MEDIOCRITY. If the A4000 had been
[design with 1024x768 non-interlaced resolution with 8 bitplanes, SCSI,
[better RAM expandability on the motherboard, ethernet as a very inexpensive
[option, the ability to use an inexpensive SVGA monitor with no problems,
[faster screen updates in the high-res non-interlaced 8-plane mode, and
[a faster memory system, then I would support it.

The A4000 has a faster memory system than the A3000. Let's say that
040 card "X" placed in an A3000 runs at twice the speed of a stock A4000.
Take card X and place it in an A4000. (The CPU slots are identical.)

This A4000 with card X will now run faster than the A3000 with card X.

DO YOU GET IT NOW? The problem is with the CPU card, not the memory system.
F*ckhead.

Better RAM on the motherboard... what a dipsh*t. The A4000 uses standard
SIMMs. To upgrade a Centris you have to buy proprietary Mac SIMMs. Who's
are going to be more expensive? Who the frig needs more than 18 meg on
the motherboard? Why is it such a hassle to get a RAM expansion card?
Can the Centris pop out its CPU and replace it with another, later version?
Can it preemtively multitask? Can it animate? Can it display >256 colors?
Does it support multiple filesystems types? How much does the Centris 650
cost? Does the model that is less expensive than the A4000 have an FPU?
Can you pipe data through several processes, each running simultaneously?
Will you ever listen to criticism? Will you ever change?

I hope you have been a hoax over all these years. I would hate to imagine
someone so ignorant and pig-headed exists.

[The Macintosh Centris gives you all of this, for a price that is LESS than
[the A4000 that we are stuck with now.

Will you ever realize that "we" are not "stuck" with anything. "We" weigh
options and buy whatever "we" want.

Source record: 208658

In article <1993Mar15.144034.5194@ctp.com> rscha@ctp.com (Richard Schaaf) writes:
>some time ago there was some talk about a program called GEMulator.
>It was a program that emulated a ST on a PC-compatible (Yes, I will
>wash my mouth later :)). I think it was written by the same person
>that wrote Quick-ST (or some program like that).

Richard, yes, Gemulator has been shipping now for over 6 months. Check
ads in the latest issues of ST Informer, Current Notes, or other American
Atari ST magazines for ordering information. German, French, and U.K.
specific versions of Gemulator are also on sale in Europe. Check ST Nieuws
or other German ST magazines for ordering information in Europe.

The current version gives you full speed Atari ST emulation on a 25 Mhz
486 machine with 4 meg of RAM. Twice to three times the speed of an ST
on 50Mhz and 66 Mhz 486 machines, 2/3 the speed of an ST on a 33 Mhz 386.
A PC with 8 meg of RAM will emulate a 5 megabyte ST, and if you have 11 meg
of RAM or more, you get a full 8 meg of ST RAM, double that of a real Mega ST.

Gemulator was just demoed this past weekend at the Sacramento Atari show.
I think Z-NET or Atari Explorer Online will be doing a write up of it in
this week's issue. We were demoing a soon to be released update which now
supports 800x600 and 1024x768 Super VGA graphics modes. This allows you to
run programs like Calamus, Pagestream, Word Writer, etc. in screen resolutions
much higher than that of a standard ST or even the Falcon. The currently
shipping version of Gemulator already supports the PC's 640x480 16 color mode.

Current Notes magazine will be publishing a full review of it in their April
issue which hits the stands within about 3 or 4 weeks.

Current prices are about $229 for the complete package including TOS 2.06,
or $179 for just the board without any ROMs. Some dealers may sell for less.
I don't sell it retail, so don't place an order with me directly.

- Darek

From: beureej@newton.ccs.tuns.ca
Message-ID: <1993Mar16.202234.6870@newton.ccs.tuns.ca>
Source record: 208798

I am thinking of upgrading my 1040stfm to 4 megs using 1 meg SIMMs.
I have the DIY memory upgrade procedure from a.a, which describes
the upgrade using SIPs. I am going to try and substitute the SIMMs
instead. My question is should I do this? I can't think of any
reasons myself as to why this wouldn't work, but I thought I'd see
if anyone else has tried this, and possibly found a problem with
it.

Those files are in the so called image format which is the binary image of
the physical disk. One can either use DiskCopy (also availible on the same
ftp sites under /dts/mac/tools) to recreate the diskettes, or use another
utilities called MountImage to mount the image as disks on the desktop. (this
of course requires you have hard drive to hold those files and you have a
running system).
The MountImage should be avalible in most Mac FTP sites, and it's a control
panel device. Boot with it in the control panel then you can select it from the
control panel. It would show about 8 icon with question mark. To mount an image
simply click on one of the icon, then the file selector would come up for you
to pick the image file. As soon as the image is mounted, a new disk icon will
shows up on the desktop. From that point on you can simply click on the disk
icon and it will behave just as if it's a real disk. So you can mount all the
distribution disk this way and run the installer. (No question would be asked
during the installation! Because all the diskettes are present and the
installition will run much faster this way). Also you don't need to have the
superdrive, the 1.44MB floppy image works just as well. (Just need to be able
to download the image files to the hard drive from your remote host).

Actually it's both comp.sys.atari.st and comp.sys.amiga.advocacy.
If you knew what you were doing on The Net you would know this. This
message thread is running in both newsgroups becuase the guy
who posted the initial message sent it to both groups and as a result
relpies goto both groups.

Pretty simple eh?

And if you really want to stop this you could take the inflamitory
spaz-fest to e-mail.

I'm sure you're misremembering, it was the Atari SH2xx host adapters that had this problem. I've used multiple SCSI devices off a Supra host adapter before without any trouble. It sounds more like the two drives mentioned in the prior posting are both trying to supply 5 volts to the TERMPWR line, and one or the other is burning out the other's power bus. This will invite total failure in a very short time, SCSI-2 or no. The trick is to simply notch out that line on the cable (it is either pin 25 or 26, I've forgotten which. I think it must be 25, since all the even lines are grounds.)

: The fact that these machines cannot generate such modes without resorting
: to expensive hardware is a demonstration of the Macintosh's hardware
: superiority.

It's a demonstration of the Mac's capability to do that. Whether that
can be considered superior, well, that's up in the air. It can be done
for circa 500 bucks on the Amiga.

I'd say it's a tribute to the Mac's bigger market for such a thing, and a
tribute to a VRAM system, but I'd stop there. There's nothing "special"
about a VRAM framebuffer in CPU space. Nothing more special than you can
get with a PC with a LocalBus VGA card, that is. Such a thing on the
Amiga isn't nearly as necessary--we don't have an ISA bus that cripples
the system, and we don't have the NuBus bottleneck syndrome. It's one of
the advantages of designing a bus from scratch rather than pulling it
from the world of mainframes.

That's greatly due to the inefficiency of the ANIM-5 format on AGA/32-bit
machines.

To be honest, I HOPE these weren't done with the ANIM opt 5 format. On
an AGA system, you want at LEAST 8, possibly 7. Word and longword
compression is important. :)

Hi!

I have the good fortune of living within 2 blocks of the only all-
Atari dealership on Vancouver Island! It is hard to even find an Atari
dealership in the city of Vancouver... but the Atari dealer here has
hardware and software in abundance.

If you would like to contact them, speak to Randy (the owner) at:
Micro-Vision Computers
#6-2220 Bowen Rd.
Nanaimo, BC
(sorry don't know postal code :-( )
phone 604-756-1933

Good luck.... Hope you find what you need!

I currently use Band-In-A-Box to do what you are suggesting. I also have Tiger Cub but Band-In-A-Box is an excellent program for recording a few measures, then filling in the rest of the song. It also comes with many different rhythm patterns built in. I think most any issue of Keyboard magazine has an advertisement for the product.

I'm in no way affiliated with them, just a satisfied customer.

That's a lot better than what I had read in other postings. Some of those sub-10 fps numbers sounded a bit too low. Do you have any results for 640 x 480 HAM8 animations? On a Centris 650, with reasonable frame-to-frame deltas (80 - 100 KB), I get about 80 - 90 fps for an 8-bit 640 x 480 animation.

I don't know Brad, but the group I read your post in is called
"rec.games.video". There was a split-up of the group in case you didn't catch
all the posts about it. However, many sites are not getting
alt.genesis/snes/etc... All the stuff about the Jaguar VS 3DO is probably in
the group it belongs in despite the fact that it is getting VERY OLD AND BORING
after a couple hundred posts in the thread...

Yes, it is true. There's no extra hardware required above what comes on
the motherboard (and maybe some extra memory). I never said I was running
QuickTime animations. (Although I can run 320 x 240 QuickTime movies at
16 bits/pixel at 30 fps with no problem. What you saw at CES must have
been the old version of QuickTime - the new compact video codec does much
better than that.) Using off the shelf animation programs I can run
animations at 640 x 480 with 8-bit resolution at 120 fps on a Quadra 800,
90 fps on a Centris 650. I'll have to double check what a Centris 610
will do, but it's probably on the order of 75 fps or so.

Stock Macintosh. Full screen. No graphics accelerators. Actually, you can achieve better animation rates using the onboard video since you don't have to go through the synchronization delays inherent in the NuBus interface.

Could be my misunderstanding. I'm not up to speed on all the Amiga animation formats/modes. I can do 320 x 240 QuickTime animations with 16-bit video at 30 fps no problem (although I wouldn't consider 320 x 240 to be full screen - more like a quarter screen). If I don't use QuickTime, I can get much higher frame rates.

Anim7 format was used, I've not been able to test Anim8 yet. I've heard
that Scala's Anim32 format is even faster, but I'm not going to buy any
package that requires a freaking dongle, no matter how great.

If anyone would like to know, the anims listed above are listed below
in the same order :

-----rwed 93-03-13 13:32:45 3685 1886240 Clown2Baby.anim7
-----rwed 93-03-12 13:50:35 5182 2652976 bladerunner.anim7
-----rwed 93-03-12 14:01:30 817 418292 GraphicsMeanPower7
-----rwed 93-03-12 13:48:52 4151 2125234 ENT-Photon.ANIM7
-----rwed 93-03-12 13:48:03 3237 1656898 BulbBash.anim7
-----rwed 93-03-12 23:17:49 995 509344 DontDrinkAndMorph.anim7
-----rwed 93-03-16 10:06:05 7030 3598996 Horror.anim7
-----rwed 93-03-12 23:20:28 1130 578526 Machine.anim7
-----rwed 93-03-16 10:40:00 320 163516 LampDemo.anim7

All of them except for Clown2Baby.anim7 and Horror.anim7 were pulled off
of the networks from various sites. I will upload both of them if anyone
would like to try out the HAM8 animations, but I must warn you that they
are pretty disgusting to look at, due to both the subject material and
the fact that my artistic abilities are sorely lacking. :-)

Clown2Baby morphs the old "Lauren" baby picture into the Clown picture that seems to be on nearly every Clone with VGA.

Horror is a morph of the same baby picture into a mutated version of the picture with a Cyclopian eye, bulging forehead, gaping mouth, pointed ears, etc.

Don't be misled by Marc Barrett's bullshit! He just states words that he's picked up over the years on the net. MARC BARRETT DOESN'T KNOW ANYTHING TECHNICAL ABOUT COMPUTERS! He dropped out of computer science a year back and is taking economics instead. In his posts he doesn't state anything technical, EVER. He justs gives some technical words here and there and to the casual observer it could appear he knows what he's saying, BUT HE DOES NOT. He's in my kill file, and has been for the last year, however I still do read some of his shit when someone replies to a message of his and quotes his BS. So a week doesn't go by that I haven't read a posting by Marc 'the computer illiterate' Barrett.

4228. where to mail order an ste?

Newsgroup: comp.sys.atari.st
Date: 1993-03-16 23:19:03 UTC
From: jacob@max.cc.brandeis.edu
Message-ID: <1993Mar16.231903.11625@news.cs.brandeis.edu>
Source record: 208668

a while back i've inquired about a memory upgrade for my
old st. since then several well meaning persons have convinced
me that it would be better to get an ste.

so here i go again...

any good advice out there as to what good mail order places
for an ste (and atari products in general are) could be?
(i'd bought my st from 47th st photo but they've stopped selling
atari...)

any help very much appreciated.

jacob

ps: if at all possible, please reply in email.

Well, somebody's gonna have to ask, so it might as well be me :-)
Does your monitor scan at 90Hz? If it doesn't, how can you get
90 different frames per second?

The most I've heard of a monitor scanning up to is 72Hz,
am I ignorant?

4231. MSTE Serial Speeds?

Newsgroup: comp.sys.atari.st
Date: 1993-03-17 00:03:35 UTC
From: u2e32@keele.ac.uk
Message-ID: <1o5psn$er3@gabriel.keele.ac.uk>
Source record: 208661

Greets to all and thank you for your time.

I was looking thru Atari Doc Support II the other day on info
about the Mega Ste's extra serial ports.
There was none. There was a little on the TT, which was followed by
a line saying this will be different on other machines with extra serial
ports.
So my questions are.

1 What is the Max baud rate of the MSTE's ports,
is it still 19200, or can I get more?

2 Does TOS 2.06 still need the fix for true RTS/CTS?

3 What are the BCON numbers for the ports?

4 Is the RS432 (lan) shared with another port (ie TT)

5 Has anyone seen any software which uses the lan port?

Thanks very much.

Date: 1993-03-17 00:11:16 UTC
From: u2e32@keele.ac.uk
Message-ID: <1o5qb4$er3@gabriel.keele.ac.uk>
Source record: 208662

Greetings most excellent keeper of knowledge.
I thank thee for thy time.

At present I have a 520STfm (Tos 1.00 2Mb mem) connected to my TNC.
(TNC terminal Node controller. Ham packet radio modem thingy. . Runs ax25
protocol. ka9q was writen to give TCP/IP using them)

This is a net.tos ax25 link.

I also have a Mega STE, which soon will have a ICD host hard disc attached.
What I want to do is install a slip connection between the 2.
Not too much of a problem, except I have no docs or source code to obtain help on.

The question. I want to set routing up, so that when I ftp or telnet, it auto
route to the STFM and then to the world via the FM's ax25 link.
So what's the problem? Well what I want to know is, when I tell route to add default STFM
slip, will the STFM know to change the protocol to ax25 before using the TNC. Or will, as I
fear, the STFM have no control to do this.

Any help will be greatfully rx'ed.

Okay, so on 5 models of machines, you can do this, GREAT...
Mac 512.. Mac +, MacSE, MacSE/30, MacII, Macfx, MacCi, MacSi, MacLC
MacLCII, Mac LCIII, Mac Classic, Mac Classic II, Mac Color Classic,
MacVi, MacVX, Mac Portable, Powerbook 100, Powerbook 140, Powerbook 165,
Powerbook 180, Mac Duo, damn it, I know I am forgeting a few models...
But the point is, how much of your installed user base can do the same
as your 040 machines?

4238. SPEED OF LIGHT version 2.1 on a.a.umuch

Newsgroup: comp.sys.atari.st
Date: 1993-03-17 01:57:26 UTC
From: stusoft@hardy.u.washington.edu
Message-ID: <1o60i6INNpir@shelley.u.washington.edu>
Source record: 208675

Finally version 2.1 of Speed of Light GIF viewer (spoflite21.lzh) is in the Graphics folder of atari.archive.umich.edu. This version works on all ataris including ST/STE/TT/FALCON. It has been tested on all of these computers without any problem. Do not run it from TT ram, however. Speed of Light includes several new features including the ability to load ANY size GIF into memory even if you have only a little free. This is acomplished by cutting the lines of the picture out as it loads in. You can also just view a section of the GIF if you want. You can still scroll around the huge picture, reduce them, or average them. RGB values can be altered and the color and flickering contrast can be adjusted to optimize picture display depending on your resolution/number of colors. It increases the palette by swapping screens very quickly so your eye sees more than twice the normal colors. This gives STs the palette of an STE plus, and Falcons get 16 million colors. The program works only in 16 and 256 color graphics modes in any resolution. The program does not use VDI to draw the pictures to the screen (that's why it's fast), so it probably won't work to well with custom resolutions unless it uses the system screen memory. It does, however get its resolution and color info from VDI, so it may work.

THIS PROGRAM IS SHAREWARE, so I would very much appreciate your support.

Thanks for everyone's patience in waiting for this version. Sorry for the problems with version 2.0 on older STs.

ENJOY!

Stuart Denman

4239. Mega STE and a HD

Newsgroup: comp.sys.atari.st
Date: 1993-03-17 02:07:26 UTC
From: psurge@cs.utexas.edu
Message-ID: <lqd1uuINNa1@levelland.cs.utexas.edu>
Source record: 208667

Ok, my Mega STE finally came in. However, when I tried to hook up my hard disk to the ACSI port, nothing happened. I recently tried the HD on my friends MEGA ST and it worked fine, but the HD busy light does not even light up, nor does the ICD driver recognize the host adaptor (booted from floppy of course).

I remember some talk about this happening. I know there are many of you Mega STE owners out there with Hard Drives. The biggest change I noticed about this is that the port is now labeled "ASCI" instead of "DMA".

I have TOS 2.5 (2.05) if that tells you anything.

Please help because I need to get this hard drive working with this system.

Thanks,

Troy Carpenter

Yes, you're right. If you write code to explicitly set the video modes and allocate screen memory, you can display any mode you want on a multisync monitor. I was only thinking of the default power-up case when I wrote the above; also, as I mentioned before, you can switch monitors on the fly, and again, if you reset the video modes appropriately, you'll have no troubles.

Yes, I am flaming... Greg, I am sorry that you mind, however, the reason I
posted the above thing in the first place is why are you people
crossposting nonsense about amigas here to comp.sys.atari.st in the first
place? Or why are you people posting comparisons of the a4000 and the mac
centris here anyway too? WHY WHY WHY?

I have gotten a great deal of good replies to my questions in this forum
(thank you everyone that has emailed me :)), but everyday there is a
continuous stream of nonsense being spewed about whose systems are
better... I have an ATARI because I like ATARI (sort of :/ I wish they had
more support for my TT). If you _idiots_ want to argue why don't you set
up another group to do it in??????? Or at least stop crossposting.
Do you get the idea now?
Or perhaps I should just start up a script that sends utter nonsense to
comp.sys.amiga.*..... like you people are doing here...
Get off the jaguar vs. 3DO or whatever crap too. These topics have no
relevance whatsoever to the ST/TT/Falcon (err falcons in Europe that is
:)) line of computers. I am sure you people have better things to do than
argue about how many frames your stupid computer can animate in a minute...

>So 57.6 kbit/s is probably the speed on your RS232 cable, not the tel line.

Yep. Although the standard V.32bis uses 14.4kbps, there is a proprietary signaling scheme that can get 16kbps. I think this is from US Robotics, but haven't heard much else about it.

Also, by using synchronous framing techniques instead of async modes, you can get slightly greater byte rates. (Async, 8 bits, no parity, still has 1 start and 1 stop bit overhead per character. Using a sync frame, you have sync bits to start a frame, 8 bits per data byte within the frame, and sync bits to end, allowing you to approach a data rate of 1 byte/8 bits as opposed to 1 byte/10 bits. This amounts to a difference between 240cps and 300cps at 2400bps, or 1920 vs 2400 at 19200bps...)

Forgive my ignorance, but my original ST never had an RF modulator for TV display.

Tell me, please, which resolutions are available through the RF modulator? Is Med res displayable on a TV, or is only Low Res? It's a long shot, but what about High Rez?

Thanks,

Troy Carpenter

Last summer, QuickTime 1.5 wasn't around.

> I have seen 256 color 320x120 (or about 120) *from the IDE hardisk*
>in 20 fps+. This is one of C='s demos.

Here are playback rates using QuickTime 1.5, at a frame size of
320 x 240, for the Quadra 950.
Note that QuickTime is very general (this is being drawn into
a clipped, possibly resized window, running from the hard disk, and
not using page-flipping).

Mac model Display depth Processor Playback rate
Q950 16 bits 33MHz 68040 42.0 +/- 3.0
Q950 8 bits 33MHz 68040 55.0 +/- 5.0

Source record: 208686

Many thanks to all of you who responded to this inquiry either by email
or by posting here. It was for the most part very enlightening.

I do, however, still have some confusion.
The consensus is that the STmf does exist and indicates the presence of
both an RF-modulator and an internal floppy drive.
On the top of my machine's case, it has a nice shiny escutcheon (?)
that says "1040STF", where the "F" is a sort of superscript.
Underneath, however, there is one of those foil labels giving the model
number and serial number, giving the model as "1040STmf".
On the third hand, however, this machine does *not* have an RF modulator
in the place where the manual says it ought to be --
there's just a solid chunk of case there,
distinguishable only by a slight seam on either side.

Can anyone offer any explanation of this?

Thanks again,
-- Kenn Goutal

A couple of months ago I found the mint port of uw in a file with some other utilities on a.a.u.e. However when I looked today I couldn't find it anywhere. If somebody has the source code for the mint version of uw could they please tell me how, or where, to get it from.

I have the non-mint version that I could port but I'd rather not re-invent the wheel since I know that it has already been done.

Low and Med Res can be displayed on the TV via RF or RGB. High Res can not be
used there as it is not interlaced on the ST.

With the Falcon this is totally different :-)

This war, haven't it been stopped a VEEERYYY long time ago?
I've been working together with many Atari guys,
for example Cugel in Omega, Guide of ACA, and most other guys who
codes on atarisar that has been in the Blue House.
If you're interested, Cugel was a member of Silents for a while,
when Silents had an Atari division...
If someone remembers the demo 'Tropical Sunset' which Fuzzac of silents
(when he was in Silents) coded, He and Cugel converted it 100%
(Except for the copper-toning) to Atari.
Cugel has done some of my Ideas on Atari, and they look really good.
(I've taken from him too, but that's not my problem)
For the last three years, I haven't noticed any 'wars' between Amiga
hackers and Atari hackers. Maybe they live in small groups on Atari,
and groups that are so small on Amiga that I've never heard of them,
But nothing has reached me.....

/Asterix - Movement
(Working on a demo with Omega on Atari, that is currently put on Ice...)

Under kickstart 3.0 using operating system friendly routines, one can attain 2,000 (two thousand) frames per second. And note, this is not banging the hardware, but is using multitasking, standard, OS calls.

I don't work for Ladbroke, or have any other connection with them, except for being a VERY satisfied customer.

The people I talked to had an excellent technical knowledge, made the effort to get equipment that everyone else I contacted just said wasn't available, and warned me away from stuff they had in stock but didn't work perfectly. Once stuff came in (my fault for being so picky) it arrived the next day, and a late item was sent free of delivery charges. They did not charge me until they delivered, so no complaints there either. Inevitably, it took some time on the phone to complete, but that was a fraction of a percent of the total bill. Best of all, they were one of the cheaper places I contacted, so I saved many times the phone bill anyway.

This is not, of course, to say that something didn't go wrong for Kevin & Stuart, but just to give another side to the story.

You have to use special comms software to reach more than 19200 baud.
Try the terminal software CoNnect which allows you to use 38400,
57600 up to 153600 baud on a Mega STE. (Ports Modem2 and Serial2)

> 2 Does TOS 2.06 still need the fix for true RTS/CTS?

Not really. There are still some bugs in it but most software is able
to compensate these.

> 3 What are the BCON numbers for the ports?

Not quite sure ... 6: Modem1, 7 Modem2, 8 Serial2 (the last 2 may be
vv)

> 4 Is the RS432 (lan) shared with another port (ie TT)

It is shared with Serial2

In a GEM program, the AES call graf_mouse() will do what you want.

If you want to learn about GEM, there's a pretty good manual around:
"Professional GEM" by Tim Oren, which also includes a number of exapmle
programs in C. Look for it at your favourite ftp place.

>Datadiet has a much better rate of compressing and is also a bit faster.
>It's DC Data Diet (from DC) but they're now Codehead I believe...

Note that both programs use totally different strategies to perform compression
-- Data Diet packs on a file basis, while DataLight works on a file _system_
[i.e. partition] basis. Both programs save on I/O time to compensate for the
added decompression delay, and both programs pack different files with
different compression ratio, depending on the file type.

IMHO it is not justified to claim that DD is overall better. You have to take
into account that DL has an overhead when first compressing a partition. If you
do a first comparison and then give up on DL, you are hasty. Let's see a
real benchmark before jumping to conclusions.

I don't have DataDiet so I can't really compare the two.

Didn't Atari clue into that with TOS 1.4 and up, and use an unsigned int
instead of an int? That makes the number of logical sectors 65536, or
32 MB (at least, that's what the limit for GEM partitions is with the
ICD host adapters and TOS 1.4 or greater).

Well, it is not misinformation what i posted, I said 256,000 colors
animation. Can you do that on the stock Mac? No.

|>
|> > |>

|>
|> - Dale Adams

Defintively, this is a must see, I would like to see the Mac doing it,
and I am specially interested if the animation jerks or jitters since
from what I have seen, normally they don't use double buffering.

I would like to see this... what programs are you using?

4267. Re: Stacker for ST

Newsgroup: comp.sys.atari.st
Date: 1993-03-17 14:04:15 UTC
From: yves@cc.mcgill.ca
Message-ID: <1993Mar17.140415.20368@sifon.cc.mcgill.ca>
Source record: 208601

I had a stacker equivalent on my st, it's called datadiet. It was
really good and it was reliable too. Unfortunately, it seemed that the 68000
processor of my 1040st wasn't fast enough to handle compression/decompression
on the fly, as the loading time of some programs would be up to three times
longer. Pagestream was a good example of such loading times...

But anyway, it worked and I never had problems with it... And it provides
a good kit of utilities and options too. Neat soft...

I've gone IBM since then...

Bye

4268. simms in STe computers

Newsgroup: comp.sys.atari.st
Date: 1993-03-17 14:06:16 UTC
From: selbyr@meena.cc.uregina.ca
Message-ID: <17MAR93.14061686@meena.cc.uregina.ca>
Source record: 208622

Is it possible to just plug in 1MB simms into a 520 STe or is a special board needed? Do you have to use 256 or 512K simms? Can it be done yourself without soldering?

Thanks

|> Civilisation is the progress toward a society of privacy.

Definitively a must see. Seems like quicktime got a very nice update.
Well, but sitll, you can't do 256,000+ color animation on the Mac. And
just in case, the above demo animation from C= could have been done
under Ham8 in 256,000+ at the same speed from the hardisk.

BTW, you are also using a 68040 @ 33Mhz, which is 8 Mhz more than the
one in the A4000 (and the Quadra 950 is more expensive too).

I too had the same problem with MiNT conflicting with CLIPBRD.CPX.
I removed all AUTO progs but MiNT,all ACC's but XCONTROL and all CPX's but
CLIPBRD. It still caused all sorts of problems. This was the same for
3 different MiNT's : 0.95 (binary from a.a), 0.96 (Lattice C5 compiled),
0.99 (Lattice C5 compiled, memory prot stuff stripped
and set up for TT i.e. 68030+68882)
My machine: 8MB TT030 with TOS 3.05UK.

Couldn't be bothered to trace the problem, just threw CLIPBRD.CPX away :-(

>Why, if a Centris is so great, do you (or your mother) own an A3000, which
>you say you use to run Mac software on? Why don't you sell your A3000 (or
>use your arguments on your mother in an effort to get her to sell hers)
>and use the money to buy a Centris?

Not my decision. I'd like to, but my mom would rather not go through the
hassle of selling the system and buying another one.

>What do YOU do with your SCSI that can't be done with IDE?

Use two hard drives. I have an internal 50M 3.5" in the A3000, and an
external 80M 5.25" drive. The 80M drive used to be connected to an A500. To
use it with the A3000, I just hooked it up, and all Amiga and Macintosh
partitions on it were accessed fine. You could *NOT* do this with IDE, under
ANY conditions.

Further, I'd like to use a CD-ROM drive, if Amiga CD-ROM software existed.

>What resoloution/depth do YOU routinely use? (With or without AMAX)

1280x1024 with 256 colors, on the DECstations at school. I have the
A3000 set to maximum overscan handled by the Workbench: 724x482. I'd like to
have higher.

>How do YOU use your system's sound capabilities?

I listen to occasional mods. But I haven't mentioned sound capabilities
in my comparisons, so that is totally irrelevant.

>What kind of software do YOU write/use?

MS Word 4.0 and WordPerfect 2.1 under A-Max. I have collected a large
number of TrueType and PS Type 1 fonts, which I have cataloged and use with
various PD software under A-Max.

>Which type of CPU is running in your system?

16.77Mhz 68030.

Marc Barrett -MB- | email: barrett@iastate.edu

I thought Atari had stated that AtariWorks and MultiTOS will be packaged
with Falcons sold with HDs in the USA. They also said they will have to
pay a licensing fee for the use of the modified AES in MultiTOS, so the will
have to charge for MultiTOS if sold seperately.

The impression I got was that US machines would get this bundle. When was
it stated otherwise?

> Ok a quickie for all you people out there in windows land...
> Which is the best type of menu ? Pull down or Pop up ?

There's a lot of literature on UI design, and you'll get a lot further by
reading it than by asking random people on the street, although it must be
said that the Clapham Omnibus is now equipped with X terminals. :-)

Some of the issues:
* how is it made apparent that there are menus?
For example,
are the pull-down menus simply words that appear somewhere?
if so, is the location special (as in the Mac)?
Or are the words sometimes marked and sometimes not (as in OSF/Motif)?
Or is there an obvious button to press?
Or is there always a pop-up menu everywhere?

* is the method of accessing the menus obvious and consistent?
For example,
is it always the same mouse button (if there's more than one)?
If so, is the button marked "MENU", as on a Sun SPARCStation?
If there's a key to press, is it always the same one?
And if so, is that key otherwise unused?

* does the user have control over the kind of menu used?
For example,
you can often turn an OPEN LOOK UI pop-up menu into a `floating menu bar'
as some of the other UIs call it, by `pinning' it.

* is there a verb-noun (or other usage) distinction?
For example,
some systems use a pop-up menu to access the properties of a selected
object (attributes), and pull-down menus to perform an opperation
(actions).

* how large is the screen?
On a large screen, having to move to the top of the screen to do anything
can be very tedious. The Mac UI was originally designed for a small screen;
most X11 user interfaces, MS/Windows and the OPEN LOOK UI, were all
designed with a somewhat larger screen in mind.

There are scattered notes on this in the OPEN LOOK GUI Function Specification
and Application Style Guide, which you have presumably read if you're
writing a paper on the subject :-)

n> respectively), but in the home market they aren't taken seriously. Both
n> Atari and CBM's stock is plummeting, while Intel and Apple's stocks are
n> soaring. Let's get it together, and realize who the real "enemy" is.

Some time ago I tentatively asked about the API to Intuition, not to mention AmigaDOS, with the intention of seeing how much the systems differ/have in common. At the time, it was more of an intellectual exercise, although I received no replies 8(

Now I ask again : is there someone out there who has hacked extensively on both platforms? Is there a possibility of producing a common-denominator interface layer that would make it possible (or just easier) to port applications in both directions?

As a software author, I'm a great bootmaker, however I've had quite a lot of success porting things from one environment to another, and there are a huge number of far better programmers on the net who have earned their notoriety doing just that... Are there great shareware applications for the amiga that could be ported to the ST? Vice versa? Not to mention the potential benefits for both markets if this trend extended to commercial software...

You're right! However: pop-up menus are faster to get at. So I propose that
every application has both pop-up and pull-down menus. Use the pop-up ones as
shortcuts, and use keystroke combinations as short-short-cuts...

It's very simple, just get my init package from atari.archive, get the MiNT
aware Unix-like utilities and shells (Bourne Shell clone and tcsh) and you'd
hardly even know that the TT wasn't running Unix!

But Master, what is the point in having the ability to add 64 MB (mega
bytes, not Master Barretts!) on the motherboard when only _very_ tiny
number of Amiga 3/4000 ever need more than a few megabytes of memory
and when there is a option of adding ram with a high speed
Zorro-III-card? Enlighten me, Grand Master B!

Source record: 208626

What is the point of posting a comparison of an amiga and a mac in an atari newsgroup? The signal-to-noise ratio has been bad enough the past few months as it is. This isn't even the periodic amiga flame-fest which is immature enough to cause some entertainment.

I've avoided kill files, but I'm starting to wonder if it's time. Even a Bob Retelle or Chris Mauritz post is at least relevent to the newsgroup, which is more than I can say for a lot of tbe posts I've been reading lately.

GhostScript is a PostScript (you know, like the printers) interpreter.
It will allow you to print a PostScript file to a non-PostScript printer
(such as any old 9-pin, or my DeskJet, or whatever) or view it on
screen.

Tim Gallivan has been keeping it running on the ST/TT platform... much
to the surprise of anyone who's seen the GhostScript source code! :-)

Presuming that this graphics chip exists... Dropping it into the Falcon
would've forced Atari to provide VRAM, improving the overall performance
of the machine, especially at "big" graphics modes (I'd really like
800x600x256 or so myself).

I guess I could knock myself on the head and dream of an '040 Falcon our
RSN with separate VRAM and better screen modes... ;-\

I can't send e-mail privately, I wish I could but since you are the
second person that has stopped by saying something about this
I'll do the following:

<<<<<<<<<<<<<< I APOLOGIZE >>>>>>>>>>>>>>>>>>>

To those that I have offended with my language, okay, I apologize.
I will not mention that this is something that hasn't been done before
(no way, right? Everyone here speaks with such an amazing grace),
but since I'll be more careful in the future, I will also like to hear
from you to tell -MB- that if most of the people do not want to see
my postings of the MAC vs. AMIGA vs. ATARI, practically 99.99999999%
of amiga users here don't want to listen to the lies and excessive
complains of a guy called Marc Barrett.

Now, will you say something to him too? If you note, I have
never resorted to saying such things before... it's just that I got
tired of Marc Barret complaining about things of the Amiga that are
simply either 1. Not true 2. Extra-exagerated 3. Simply his opinion,
not a fact as he puts it or 4. Something (usually a lie) about what
the competition has that definitively without it will take the Amiga

to its doom.

Okay, if I abused the English language, I apologize, I'll be more
careful...

Raist
New happy A1200 owner
256k colors, 1280x400 ** I LOVE IT **

That's a measurement of the page-flipping, and nothing more. If you take a screen, you can "page flip" through OS routines that fast. That's not including drawing time, of course.

Source record: 208644

Some of you may recall when John Hutchinson asked this last year, and I was among those who answered yes. Well, here we are, five or six months later, still no Falcons in Canada, and things have changed.

Timing is everything. Before the new Macs and Amigas were introduced, the Falcon looked to be a little expensive. Now it looks to be a lot expensive. It used to look a little underpowered, and now it looks a lot underpowered. Yes, I know, they don't have DSPs. But a DSP is not a magic bullet.

What has always bugged me is that the Falcon looks like it was designed prinicipally to make it easy to sell the next model. It's stupid.
Why save a few bucks on the case when you have to turn around and blow that and more on a custom memory board, and a 2.5" hd? (They're still less common and cost more/Meg than 3.5") Is there anyone who prefers a console to a detached keyboard? This approach can only be cost-effective for the basic version (1-Meg, no HD), so other versions must have been in the works all along.

My feeling is that they had planned to have the Falcon030 in the stores long before now, so they could introduce something like the 'Mega Falcon030' and 'Mega Falcon040' this spring. What would be typical of Atari would be to hold onto the other machines for much too long, even if they were ready for production, in order to sell some Falcon030s at a premium price.

But somebody screwed up. Their cash flow right now must be terrifying.

I think the only hope for Atari in the computer market is if they:
1) (Re)introduce the Falcon030 at a (significantly) lower price.
2) Start selling the more powerful machines ASAP, at prices not much higher than were first planned for the Falcon030.

The way it's looking, I may still get a Falcon. But it will be after Atari finally throws in the towel and gives up on computers forever. There will be a short clearance sale, and I will get one as a cheap upgrade to my 520ST.

I'm planning to wait. We'll see what happens at Cebit.

I believe this is the rate at which AGA can swap screens, and therefore each frame can be completely different from the last. (Even resoloution, palette etc.)

>route to the STFM and then to the world via the FM's ax25 link.
>So what's the problem? Well what I want to know is, when I tell route to add default STFM
slip, will the STFM know to change the protocol to ax25 before using the TNC. Or will, as I
fear, the STFM have no control to do this.

The TNC is connected to the STfm thru the RS232 port, right? You will have to
use the MIDI port to connect to the Mega STe, or you could use the centronics
port. (Centronics support depends on which version of NET you're running...)
Assuming the MIDI port, you simply put an attach line like the following in
your net.rc file:
attach asy MIDI: 0 slip sl1 5120 256 38400

Then for routing you add this line on the Mega STe:
route add default sl1

and this line on the STfm:
route add megaste sl1

(Replace "megaste" with the name or IP address you assigned to the Mega STe.)

The attach line says to add an asynchronous serial interface, use the MIDI
port, don't echo incoming data to the outgoing port, use the SLIP protocol,
give the interface a name "sl1", allocate a buffer of 5120 bytes to the
interface, use a maximum transmission unit of 256 bytes, and set the port
speed to 38400bps. You can use any name you want for the interface, as long
as it's unique. The buffer size should be a multiple of the MTU size. The MTU
can be any reasonable size, I generally use 1024 instead of 256. The baud
rate is bogus, but the ST version of NET should recognize both 38400 and 31250
for the MIDI port. (The only other available speed on the MIDI port is 7815,
which is the same speed used by the keyboard interface. "9600" will also select

that speed on the MIDI port, but there's no good reason to use that speed...)

This is a pretty likely problem, although usually the initial negotiation
will fail completely when the connection isn't 8-bit clean. The other
possibility is that RTS/CTS flow control is not being used on the Unix end,
or is not being recognized by whatever intermediate device is present.
>
>The other potential problem is that your tty is not set to be 8-bit

Of course high-resolution non-interlaced modes are inherently slow (because
of the larger amount of data) and unusuable for recording animations.
Non-full-screen animations are also just usuable to show off. That's why
it is perfectly valid to compare low resolution and interlaced animation
capabilities.

> as your 040 machines?

Well, some of the models you mention are the compact Macs which have a built in single frequency display - obviously they don't/can't do this, but then it could be argued that they don't need to. The Mac II, IIx, IIcx, and IIfx all need a video card (since there's no video hardware on the motherboard) so having this capability really depends on what card you plug in (and there are a number of 3rd party cards which do this). It's probably possible on the IIci, IIsi, LC III and the PowerBooks with video output capability but I've never heard of anyone doing it.

But you're certainly correct that the majority of the Mac user base doesn't have this capability. The '040 machines (there's actually 6 of them, not 5) have a very programmable and flexible video controller which allows this. This is lacking on most other Macs, although it could be added via a video card (but then it's certainly not a standard feature).

Yeah, so does mine, but the 'f' is really small, not much taller than the
crossbar on top of the 'T', more like a superscript

______ __________
| ____| |___ ___| f
| |___ | |
|____ | | |
| | | |
___| | | |

You (and I) have an STF, built-in floppy, no RF modulator. That Atari
uses other abbreviations in their internal model and serial numbers is
only a ploy to confuse the enemy ;-)

STM, STF and STFMs all exist. With the advent of the STE(xtended), RF
modulators and built-in floppies became standard issue, s the need
for the F and M model indicators disappeared.

I would like to restate something, These spec's are right from the
factory. If anything is left out (with the exception of the Blitter chip
and I apologise for that, it should have been caught....though it is
rather understood by everyone now.) then the factory must not have
thought it was a key selling point of their hardware (ie copper).
I have not brought this here to be biased (this is not the media!), just
to see where our beloved computer stands in the real world.

Talk to you later...

>On the third hand, however, this machine does *not* have an RF modulator
>in the place where the manual says it ought to be --
>there's just a solid chunk of case there,

When I got my 520STfm upgraded to a 1040STfm they gave me a new shiney
sticker(although it was hard plastic) and I pulled the 520 lable off and
put the 1040 label on. With this in mind, maybe someone at the plant just
screwed up what stickers they put on your machine...
If someone was to look at my machine today they would see the 1040ST
sticker, but it would have a RF modulator, so that would cause some obvious
confusion.
ATARI has made error before ::snicker:: so they just probably made an
error with your machine too.

Yes. About 860x740 is running at 55Hz here Germany. No hardware is required.
I talked to the gyus who did it.

4321. Calling UNIT 17! Come in UNIT 17!

Newsgroup: comp.sys.atari.st
Date: 1993-03-18 11:23:44 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Mar18.112344.4642@dct.ac.uk>
Source record: 208555

This message is primarily directed at th Group Unit 17, but if anyone else can help, by all means do!!!

I put out a query a while ago about not being able to get the MIDI function in Unit 17's ace STE music demo - Dynamite- to work.

I got reply from one of the group's members telling me how to get it working, he also told me about an ACCessory they were going to release which allowed 8 channel Samples to played from STE via a MIDI keyboard. He asked me to mail him for more info, which I did. Twice. Now apparently our mailer here was a bit unwell at the time, so I have no idea if it reached him or not, which is why I've mailed here.

Is there any more news about the accessory?

I still can't get DYNAMITE to play samples via me keyboard, I did as told and tryed typing SHOWMEALL<CR> (whatever <CR> means!) but I still couldn't get it to work. Have I got an old version of the demo? I ftped it from atari.archive.umich.edu.

Any help would be highly appreciated!!!

Cheers,

Feekzoid

jw> I would generally choose to use a pull-down menu, for the simple
jw> reason that it's existence is plain to the user.

In a consistant system it's obvious that a pop-up menu exists, since
it always does (i.e. every window should pop up somethign when the
relevant button is pressed).

The big problem with pull downs is that they take up room on the
screen. Not so much of a problem on a Sun, but on a little PeeCee or
Mac screen you want as little clutter as possible if you expect to get
any work done.

The correct answer to all of this is let the user decide. That way
even if you and some other developer disagree as to which is best, the
poor guy at the sharp end can still have a consistant view of the
world.

4327. ZX Spectrum emulator for ST

Newsgroup: comp.sys.atari.st
Date: 1993-03-18 14:20:55 UTC
From: jens@kssun3.rus.uni-stuttgart.de
Message-ID: <1oa0g7$iju@news.uni-stuttgart.de>
Source record: 208558

Since I can copy ZX Spectrum programs from cassette tape
to Atari/MSDOS diskettes I am wondering wheter there's
an emulator for Spectrum programs for the ST or PC,
either handmade or commercial. (So I wouldn't have to
program one myself =;>)

Any information on where, what, how much, ...
is greatly appreciated. Good old Sinclair times are gone, (sob!).
Bye, Jens

4328. Re: REXX for ST

Newsgroup: comp.sys.atari.st
Date: 1993-03-18 14:41:06 UTC
From: aa454@Freenet.carleton.ca
Message-ID: <1993Mar18.144106.21409@freenet.carleton.ca>
Source record: 208563

In a previous article, Dconroy@outb.wimsey.bc.ca (Dave Conroy) says:

>Is there a REXX programming Language for the ATARI ST? There seems to be
>ones for every other platform..

There doesn't appear to be one.

This may be partially related to the fact that there is very GOOD support on the ST for REXX's nearest competitor, Perl.

Perl does most of the same things that REXX can, and possibly has somewhat better parsing features than does REXX. Perl does process control, with all of the "wonderfulness" of The UNIX Way (TM).

The two languages seem to be particularly distinct as follows:

a) REXX tends to be a somewhat proprietary system. IBM invented it (I've got one of their manuals kicking around somewhere - my only "real" IBM product in umpteen years of doing computer stuff!) and anybody that develops interpreters tends to charge money for it.

Perl on the other hand was created under the GNU GPL, and people don't develop their own versions in order to charge for it.

b) Perl makes fairly extensive use of prefix characters to determine the "type" of any particular variable. $var is a value; @arr is an array containing various value; &myroutine is used to refer to/call "myroutine," a subroutine.

REXX makes relatively little use of such "special characters."

c) Perl does pattern matching using regular expressions.

REXX doesn't have that level of generality.

If you have some application for which an interpretive language that deals kindly with strings and numbers, and which knows something about process control, either REXX or Perl should be able to do the job. I don't think we're likely to see an ST port of REXX any time soon; this leaves Perl as "the tool for the job." If you've got code in REXX that you want to use, then maybe you'll have to develop a REXX-->Perl translator. Many people would be pleased to see such a product, I'm sure.

Since we are having all this discussion in the abstract in most of the world perhaps it would help to know what's happing in Germany.

1. How available is the Falcon? In what kind of stores?
2. What is the competetion?
3. How is the Falcon doing agains the Competition?
4. Is the market for the Falcon in anyway different from that for the ST?
5. What if anything is the press saying?
6. Etcetera

Could be. Three of them didn't exist on my board either, but the list
stated which pin on the MMU went with each resistor, so it was pretty
straightforward to solder in some new ones. I did have some doubt about
which pin was which, but the phone call cleared that up no problem.

>yves@cc.mcgill.ca

I have data-diet also, I compacted all of the data files (this is what
data diet does, they have another utility called Squishem or something
that compacts executables) and then I went to use my system.... to get to
the poni, my system totally got screwed up because of the compaction and I
had to reformat the HD. I have heard from many people including the
Codeheads that this has happened frequently.... but I have also heard that
alot of people like it...
I tossed the program out of my HD, if anyone wants to buy it I will sell
for $20...
Instead of using the program i bought another HD, Toad computers has a
good deal for drives for the TT, I bought a 130 meg for 399 dollars! It is
much better than a disk compaction program...

>
>BobR

Once again Bob spreading false rumors....

Atari-Works (Including Speedo-GDOS), and Multi-TOS, as well as the other
goodies, are being packaged with the 4meg+65HD, and 14/65HD units.
(Or, any machine with 4-meg of RAM or higher, and a Hard-drive...)

The packages are being sold seperately also, so owners of TT's, ST's etc.
can get their hands on them if they want! The prices will be around
the $120 mark somewhere as stated, (which really is too expensive, getting
into macintosh prices... :)

Well, the problem is the original poster doesn't have a running system!
I had this same problem. Forget ftp-ing files, running all these utilities
on a Mac which you don't have yet.. The easiest way is to go to any good
Mac full-service dealer, they will usually sell you any System 6 version
for just a service charge. (It's four disks, so bring four blank dsdd disks).
They're bootable Mac disks, you just shove in the system disk when Spectre
asks for it. From there you're all set!

>>at 8-)

>Er, no... the latest story from Atari is that they're going to SELL
>those goodies separately. AtariWorks will be $129, and MultiTOS will be
>about the same.

Ya know, the two are not mutually exclusive. As I understand what
B.Brodie said on the last Rountable, it will be included with new Falcons, but
it will be made available for a price to current atari owners (I believe the
question was originally about SpeedoGDOS but since it is being distributed
with Atari Works ...). The $129 is the price to buy it without buying the
Falcon first (a new one that is - too bad they can't retro-offer it to current
Falcon owners...).

>John Townsend says Atari would "appreciate" a few bucks for their
>hard work

If it is half as good as they say it is, they deserve the $$. It would
be worth half that just for the SpeedoGDOS.

4343. The _best_ HD cache?

Newsgroup: comp.sys.atari.st
Date: 1993-03-18 21:39:19 UTC
From: paetau@mits.mdata.fi
Message-ID: <1993Mar18.213919.26005@prime.mdata.fi>
Source record: 208576

I'd like to know what is the best, most magnificent, state-of-the-art, non-crashable, in other words the ultimate HD cache program :)? And where to get it from of course.

Is there any disadvantages in using disk caches? I heard something that they can sometimes ruin your FAT if the electricity suddenly "stops", I don't know the exact word for it.

Thanks!

Nothing. The point I was making was that NuTek claims to be the first company to make a machine that can run Mac and PC software. That's rubbish. A Mac can run PC software, and an Amiga can also run PC and Mac software!

Also, Apple claimed that "Nobody" could make a machine that ran Mac software and not infinge on their patents. Why haven't they sued the companies that make Emplant and Amax for the Amiga, or Spectre for the ST? The same reason that they didn't sue Commodore when they sued Microsoft and Hewlett-Packard: publicity. After all, most people haven't even heard of an Amiga (or ST, for that matter) and they'd just as soon keep it that way.

No, not at all. I believe it was either Spencer Shanson or Chris Green that detailed it. Perhaps if either of them take enough time away from their work at Commodore to read Amiga advo, they can give us a bit more of the details.

I thought NuTek's claim was to have made the "first Macintosh
clone". Which, I think, they have. An Amiga with Amax is an
Amiga running Amax, not a Mac clone as such.

>Also, Apple claimed that "Nobody" could make a machine that ran Mac software

Emplant, Amax, and Spectre do not come with Macintosh ROMs included.
Thus, they do not break any copyright laws.

Jeremy

>Codeheads that this has happened frequently.... but I have also heard that
>alot of people like it...

I have DataDiet version 2. I've been using it from the very first version on my TT and I've never experienced any major problems with it. It should _NEVER_ cause you to have to reformat your hard drive! It only uses standard DOS file copying routines and is just as safe as any other ST/TT program out there that reads/writes to disk.

If you want to play on the safe side, just make sure all your boot programs and files (and their related resource and data files) are NOT compressed (simply add them to the excluded filenames in DD).

>I tossed the program out of my HD, if anyone wants to buy it I will sell
>for $20...

At that price, I'm sure you already have a buyer!

>Instead of using the program i bought another HD, Toad computers has a
>good deal for drives for the TT, I bought a 130 meg for 399 dollars! It is
>much better than a disk compaction program...

I have a 135meg HD in my TT and an 88meg Syquest and I still wouldn't want to live without DD!

To anyone considering DataDiet, if you're smart and safe, you'll love it! (especially if you have a speedy TT or MSTe)!

Here, this is reposted without permission:

From: newsbytes@clarinet.com
Subject: ****Macintosh "Workalike" Runs Mac, PC Software 03/16/93
Date: 16 Mar 93 20:51:25 GMT

CUPERTINO, CALIFORNIA, U.S.A., 1993 MAR 16 (NB) -- Nutek promised over two years ago, in February of 1991, it would deliver a Macintosh-compatible computer to market, and the company has now made good on that promise. However, Nutek has gone a step further and says its motherboard and system software will also run software designed for the IBM and compatible personal computer (PC) platform as well.

The company says its new motherboard and system software incorporate both Intel 80486 and Motorola 68030 microprocessors in a single stand-alone desktop system. The system software is based on the graphical Open Software Foundation's (OSF) Motif interface.

Other companies have offered products for running Macintosh software on PCs, such as Newport Beach, California based Hydra Systems with its Andor Card for PCs, but Nutek is the first to develop its own read-only memory (ROM) that is Macintosh compatible. Hydra Systems produced its Mac compatible product by cannibalizing old Macintosh computers for the ROM and installing it on the Andor Card to allow PCs to run Macintosh applications.

Nutek says it has checked through the legal aspects and doesn't expect Apple can stop it from producing the Duet. So far, Apple Computer has made no formal attempts to stop the production or distribution of the Duet although Nutek is certain Apple is aware of the product, according to company president and founder Benjamin Chou.

The Nutek Duet is not compatible with every software package on the market for Macintoshes and PCs, but the company says it has a list of hardware and software with which the Duet is compatible. Chou calls the Duet a "workalike" and says of the top thirteen software titles for the Macintosh, the Duet will run all but Microsoft Excel and Microsoft Works. The company lists over seventy software and hardware titles that work with the Duet, including network cards by Farallon and Asante, software from Adobe, Lotus, Microsoft, Aldus, Wordperfect, and hardware from PLI, US Robotics, Hewlett-Packard, and Apple

Computer. Other popular software titles not working now are under testing, Nutek said.

The company says it has orders from Europe and plans to sign up US dealers this month. The system will be sold through authorized dealers and will be available in volume within 90 days after receipt of orders, Nutek said. The list price to dealers and resellers of $899 undercuts Apple Computer's prices, but is higher than PC prices once components such as hard and floppy drives, a monitor, and a case are added. The Duet will support color however, in resolutions from 640 x 480 to 1024 x 768, Chou added.

NuTek will exhibit the Duet at the German Cebit trade show in Hannover scheduled for March 24-31. The company's booth D9 (stand E36/F35), will be located on the first floor of Hall 8 in the USA Graphics, Imaging, and Multimedia Pavilion.

There is only one "true" edition of Star Raiders. That being said, there were a number of games that were CALLED Star Raiders. But they weren't the Real Thing.

>What platforms is Star Raiders available on?
- Atari 8 bit (the "true" version, and Star Raiders II)
- Atari 2600 (almost "true" - there just wasn't enough power to it to do it quite right. They tried.)
- Atari ST

>What versions of the game are there?
The 4 versions mentioned above.

>Did Star Raiders II suck, or was it my imagination?

It wasn't TERRIBLE - it just wasn't nearly as good as the original, so that in comparison it sucked.

In the bad old piracy days, I had a copy. Only played it once. And went back to the original cart.

>Was Star Raiders for the ST different than the 400/800
> version?

Yes. It had "flashier" graphics; they went for a hexagonal map, multicoloured aliens, and a much more complicated looking photon torpedo shot.

Flashy, but they wasted half the screen on "flash," and didn't soup up anything that was useful to game play.

The "true" version had no ostentatious flashiness; everything went towards the game. I really wasn't happy with the game design on the ST version. It was not improved from the original, despite the potential of the more powerful hardware.

I would have been much happier if they had made as perfect a clone as possible, and merely used the improved speed/sound/colour set to make the game somewhat "finer." Unfortunately, they didn't have a game that was as good as the original.

I still fire up the 800XL now and again to run Star Raiders...

Woops, sorry about the sloppy formatting there...
Um, just as a question, would 2,000 frames per second seem any
"smoother" than 60fps. I wouldn't think so, but that would mean
anyone could make extravagant claims about the hardware. I guess
there must be a way to test this..
On a kinda related note, I finally got to see some nice AGA
HAM-8 animations using the new Anim-8 format (included in the latest
release of ADPro) very recently. One of them was an Imagine rendered
spaceship flyby, which was *very* smooth (nicenicenice), and there
were also a few other things, such as a Scenery Animator anim flyby
and a few other nice things. I would encourage anyone doubtful of
the Amiga's abilities to take a look at these; it sure demonstrates
the machine's graphics power.
Also, has anyone taken a look at the latest distribution of
ViewTek (by Thomas Krehbiel)? There is a Anim8 competitor in there
called Anim7. The author claims it is better than Anim8 and that
people should consider Anim7 as a standard. Has anyone else heard of
this?

>history, but it's not in the FAQ and I need to know.

You can put down that asbestos shield now.

>What platforms is Star Raiders available on?

I'm not aware of any non-Atari platforms, unless perhaps the ST version runs on that GEMulator thing (ST emulation on a DOS machine; hardware).

>What versions of the game are there?

Atari released versions for their 8-bit 400/800 series (which includes 130XE) and for the ST line. [Anyone know if it runs on the TT or Falcon?]

>Did Star Raiders II suck, or was it my imagination?

Must have been your imagination; I liked the variety of combat scenarios, and the fact you could finish it without adolescent reflexes. True, it takes longer to finish a game, and the destroyers and flagships are hard to hit cleanly in open space, but don't let them into low planetary orbit...

>Was Star Raiders for the ST different than the 400/800
> version?

A little, but mostly much better graphics, and a small window below the main viewscreen for: map, scan, aft view, etc. All in all, a faithful port.

4360. Re: Will I buy a Falcon? revisited.

Newsgroup: comp.sys.atari.st
Date: 1993-03-19 05:04:06 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1obk86INNl80@usenet.INS.CWRU.Edu>
Source record: 208591

In a previous article, smiller@bcarh837.bnr.ca (Scott Miller) says:

>Some of you may recall when John Hutchinson asked this last year, and I was
>among those who answered yes. Well, here we are, five or six months later,
>still no Falcons in Canada, and things have changed.
>
>Timing is everything. Before the new Macs and Amigas were introduced, the
>Falcon looked to be a little expensive. Now it looks to be a lot expensive.
>It used to look a little underpowered, and now it looks a lot underpowered.
>Yes, I know, they don't have DSPs. But a DSP is not a magic bullet.
>

There are still problems at Atari. The more I read Bob Brodie's
conferences, the more I am assured of it.

If you would ask me what improvements need to be made at Atari, I would
say that the Tramiels have to hire more competent people.

Bill Rehbock has his hands full already and he is being given more and
more stuff to do. The Tramiels obviously think that he does good work,
but if they keep piling stuff into his arms, he's eventually going to drop
everything.

They need to hire more people like Bill.

Bob Brodie said the Falcon030's were late another month because of
supplier's of certain components. Let's think about this for a second.

The Falcon030 was delayed until March because of manufacturing plant
problems. Is he going to tell me that someone didn't check with suppliers
during this time period to make sure they had what they needed?

If Atari had a Bill Rehbock that made sure this stuff was taken care of,
there would be no delay.

Now, I'll probably get Bob Brodie really pissed off for saying this,
but I think he writes too much. It was just a few weeks ago that he was
talking about how "he" would like to see Multi-TOS distributed on GEnie
and then free everywhere else a few weeks later. Now, he is saying that
it may cost loyal Atari users under $100 to purchase it?

Commodore Amiga owners have had their Multi-TOS for 8 years and now
Atari is considering selling their Multi-TOS for somewhere under $100?
That is a nice way to repay those that "kept the faith."

If he said, under $40, I'd think about it. Under $20, and I'd say Atari
does care about those that remained. Under $100, I think I'm being
screwed.

If he would just stop talking about Atari's future plans, I think that he would do an excellent job.

>What has always bugged me is that the Falcon looks like it was designed
>prinicipally to make it easy to sell the next model. It's stupid.
>Why save a few bucks on the case when you have to turn around and blow that
>and more on a custom memory board, and a 2.5" hd? (They're still less common
>and cost more/Meg than 3.5") Is there anyone who prefers a console to a
>detached keyboard? This approach can only be cost-effective for the basic
>version (1-Meg, no HD), so other versions must have been in the works all
>along.

No, I disagree with you there. I think Atari needed a low-priced model to sell in numbers.

The retail price for 4 megs and 65 Meg HD is $1299. I'll bet by next year at this time, it is retailing for $999.

Besides, I wouldn't want a PC style computer case at the speed of 16 MHz. My friends would laugh.

The speed has to be at 32 MHz.

>
>My feeling is that they had planned to have the Falcon030 in the stores long
>before now, so they could introduce something like the 'Mega Falcon030' and
>'Mega Falcon040' this spring. What would be typical of Atari would be to
>hold onto the other machines for much too long, even if they were ready for
>production, in order to sell some Falcon030s at a premium price.
>
>But somebody screwed up. Their cash flow right now must be terrifying.

Yes, someone screwed up. And what is more terrifying than Atari's cash flow is that these people remain with the company.

Again, Atari needs competent people to help make sure that EVERYTHING is going to plan.

If you don't have competent people, you as might as well forget about competing.

I believe there are competent people working at Atari, but I don't believe that there are nearly enough to get the job done.

>
>I think the only hope for Atari in the computer market is if they:
>1) (Re)introduce the Falcon030 at a (significantly) lower price.
>2) Start selling the more powerful machines ASAP, at prices not much
> higher than were first planned for the Falcon030.

Are you kidding? There is NO hope for Atari in the computer market.

Not yet.

Atari needs to get 2 million Jaguar systems manufactured and sold this year. The Jaguar can get Atari to the billion dollar mark.

From there, Atari can release the Mega Falcon030, Falcon040, and Falcon060.

Atari will have enough funds to promote it then.

And perhaps even sell the Falcon030 as they did the 800 XL and how Jack sold the C64.

If the Tramiels are smart, they are using the Falcon030 to keep them in the computer industry until the Jaguar brings them funds to really market their computers.

>
>The way it's looking, I may still get a Falcon. But it will be after Atari
>finally throws in the towel and gives up on computers forever. There will
>be a short clearance sale, and I will get one as a cheap upgrade to my 520ST.

I don't have version 2, but have been using version 1 since it came out and I never had to reformat my hard drive. I did have a hard drive crash, but that was caused by the physical death of the drive and had nothing to do with Data Diet. Its not perfect. It can slow things down. You likely have to tinker with the configuration to get best results. You can tell it what to compress and what not to. And what degree of compression to use. It didn't take me all that long to get it set up and rarely caused problems after that. Most problems I had with it were my fault. If I ran really low on hard disk space, it might blow up. I'd have to clean up a bit, but no permanent damage, no need to reformat. I'm not suprised that the Codeheads would say that such things happened frequently. I mean, there was never any love lost between them and Double Click from what I read. Mark...

>one that can cope with overscan, and hopefully custom modes..
>
>Thanks
>
>Algo

There are quite a few good monitors out there... here are some I have
heard of...

TVM Mediascan 6A digital $1108 expensive but a very _very_ good monitor
NEC 5fg $1350 but it is one of the best monitors made Period.
Amdek am/817 $1041 good at resolutions below 800x600 and is cheaper than most
Sony CDP-1604s $1159 uses color stripes which make round pixels. trinitron

the NEC will cope with pretty much every mode you can throw at it... the
others I don't really know.

Yes, I should have made it more clear.. it's for machines other
than the Falcons with 4 Megs or more that Multi-TOS will be
sold separately.

I'll check again with John Townsend about AtariWorks if I can catch
him before he leaves.. as of earlier this week, he's resigned from Atari.

My impression from what he'd said was that AtariWorks was going to be a
separate product.

: Henrik "Henrik Hjort" Hjort

I don't know if this has been mentioned but GNU has a new program
called gzip. One of the files in the distribution, gzexe spelling??,
lets you create a self extracting file that is executable. I tried
it on a unix machine tonight and it compressed a 330k file into one
of only 150k. I haven't tried it yet on my Atari so I don't know
how long it would take to uncompress the file on the fly on my
machine. I did notice that there was a makefile for the atari computer
in the distribution.

>can get their hands on them if they want! The prices will be around
>the $120 mark somewhere as stated, (which really is too expensive, getting
>into macintosh prices... :)
I think this is quite cheap. Even at this price (translated in dutch
guilder, and I am not going to pay more than f240,-!) I am buying Atari
Works. Certainly now I know a bit more about which import/export
abilities will be included (wait for Cebit for more info.)
Considering that MS Works e.g. is priced at over f400,- officially, the
price is low. Especially when 14 Bitstream fonts are included with
SpeedoGDOS. I don't think I will buy Multi-TOS, but I like what
Multi-TOS does to programs. It will make sure that programs are
programmed cleanly, for otherwise they would certainly cause memory
violations and the stuff and would not multitask correctly.

>"stops", I don't know the exact word for it.
This only happens if the cache "waits" for writing sectors to the disk.
Caches that are "write-through" do not cause FAT damages.
The standard cache-program, that I use is cachexx.prg where xx is the
number of cached clusters one wants. It can even be configured for
different amounts of data and directory information. You will need TOS
1.4 or higher to use this program efficiently . This program is
reliable but I don't know for other caches, since I do not switch
programs if a program works for me (it would only cause trouble).
However I have heard the TCache is the very best cache program in terms
of performance and flexibility.
Both should be available from any good ftp-site that carries
atari-stuff. E.g. atari.archive.umich.edu and its mirrors like
src.doc.ac.ic.uk and e.g. ftp.tu-clausthal.de.
The cachexx.prg is sometimes part of a suite of TOS 1.4 patches.

Happy hunting.

Erlend.

From: wmtwen@rw8.urc.tue.nl
Message-ID: <7709@tuegate.tue.nl>
Source record: 208503

So what is the best software set-up for beginners?
and what for experienced users?
I am sure there must be some concensus on what is best.

A complete software set-up should at least include:
a word processor
a data base
a spread sheet
a drawing program
a comms program
and a harddisk maintenance/backup program if applicable.

So what would a shareware setup look like and what would it cost?
Fastbase? Opus? Mydraw? Dterm?
Let me hear your opinions on this.

And a commercial set-up? Using only american programs?
Atari-Works? Diamond Edge/Back II? Stalker?

And what would be a typical German solution?

Again prices would be appreciated.
And what programs are missing from the list?

The reason for this poll?
Well, I have a friend who would like to have some advice on buying a computer and has asked me what a good Atari set-up would look like. I can advice him on hardware, but on software I could use some help from you.
And of course this will lead to enormous amounts of flames. What is better and what is total crap and such...
I would much rather read flame wars on this topic than about Amigas PCs and MACs or Nuteks and the like.

Erlend.

My favourite (ie. the one I use on my harddisk) is ColdHardCache, available on atari.archive. It has resizable cache blocks and number, you can select which drives to run it on, it won't write data to the harddisk if it knows it won't change anything, and it has an ACC to display what the current statistics are.

It doesn't however have a write cache. One or two do and I wouldn't like to trust PD software to do write caching on my drive! If you have and ICD of course then you use the ICD driver.

OK?

David.

> One other thing, Marc, if there was a new amiga out which had all what
>you wanted would you really buy it and be content? Or would you buy it and then
>slag it off form being , in your opinion, a load of crap???

If this Amiga came up with the following:

040/060/RISC with full burst mode enabled
1024 X 1024 X 200k(colours) non-interlaced resolution in HAM8
SCSI-II card as standard
DSP as standard
16 bit sound
Built in Ethernet
2.88 meg HD with redesigned Paula running the drive at full speed

500 meg SCSI-II Hard Drive (presumably able to transfer data at 10Mb/sec, right?)

He still wouldn't be happy. You know what he'd do? He'd use it to emulate a mac because he'd then say that it can emulate a mac better than a mac can do it. He'd then bitch about the Amiga not having CD-ROM software, that Amiga doesn't allow the monitor to display the 16 million colours at the same time (what kind of resolution would that require, I wonder?) and he'd bitch that HAM8 was not good enough cos you can still get fringing and he wants a real way of displaying 200+k colours. And oh, he'll also complain about our OS and the lack of applications to run the program in.

Mr M Barret will never be a happy man.

4376. Video Shifters

Newsgroup: comp.sys.atari.st
Date: 1993-03-19 10:02:16 UTC
From: stuart@csc.liv.ac.uk
Message-ID: <C44rvs.FnE@compsci.liverpool.ac.uk>
Source record: 208512

Hello,
for various reasons beyond my control, I think my video shifter chip
is very flaky, every so often without warning the bit-planes go out of line,
and (I usually use medium-rez) the green, red, black etc all separate. It
looks terrible, but the machine still works fine, if you can read anything :)

So my suspision is that it's something specific like the video shifter,
how much is one, even roughly 50 pounds, 100 ? and even better where in the
UK (not Ladbroke, they probably caused it, but that's another thread) can I
get one,

thank-you,

Stuart

4377. Re: Fix for the Modem2 port on TT & Mega STE

>2 and doing a null-modem transfer to my PC have gotten around 3000cps.
>I use the Connect 1.92 term program for this (since it seems the friendliest
>in terms of handling the extra ports, etc)...
>
> Anyways, summary: Serial Fix 2.0...

I have tried it, and I still get "Bad table" and "CRC error" when I
uncompress archives. I don't know if I can send something without getting
errors, I've only tried receiving. When I read in the docs supplied with
Serial Fix 2.0, it said that it only fixed the errors on the St compatible
modem port. So I am really stuck now.

I use Gem Zmodem from Michael Ziegler, Connect 1.95 and a ZyXEL 1496E 5.04
modem, in case you should know of some troubles with that combination.

Date: 1993-03-19 11:46:00 UTC
From: boender@dutiws.twi.tudelft.nl
Message-ID: <C44wop.1B6@dutiws.twi.tudelft.nl>
Source record: 208521

Hi all,

groff 1.07 has been ported to the Atari ST and MiNT.
I have uploaded it to atari.archive and sol.cs.ruu.nl last week,
but it hasn't been put in Newitems yet.
So, if you need it, it's available at the ftp site
irz301.inf.tu-dresden.de (in Germany, Europe).
The directory to find it in is: /pub/atari/Gnu/Groff

Thanks to Michael Hohmuth for his support on the ftp site!

And please, please read the 'readme' first to see whether your
system can support groff...

Any questions, comments etc to:

4381. Help with Phantasie I

Newsgroup: comp.sys.atari.st
Date: 1993-03-19 12:01:46 UTC
From: wmtwen@rw8.urc.tue.nl
Message-ID: <7713@tuegate.tue.nl>
Source record: 208520

Hi,

recently I purchased a copy of Phantasie I. This one is really old but
still fun to play. Just until now. I am really stuck and would like to
finish the game. I have got almost everything. Every rune, water, earth,
fire and air and even the god rune. I also have six of the nine rings
and the wand of nikademus. Now I need to get into the Temple of the evil
Dosnebian priests. I have got some hints, but when I arrive at the
temple I cannot apply these hints. I just am not allowed inside.
Help! Help! Who knows what to do next.

Erlend.

4383. ST editors for Kawai K4

Newsgroup: comp.sys.atari.st
Date: 1993-03-19 12:46:27 UTC
From: danny@nessie.mcc.ac.uk
Message-ID: <1993Mar19.124627.11528@nessie.mcc.ac.uk>
Source record: 208518

Hello all,

I'm in desperate need of a librarian/editor for the Kawai K4.
Preferably it would be pd, since it is quite likely that I will
be selling my ST soon and hence would rather not have the financial
outlay.

Thanks,

Danny

4384. Need help with some EPROMS

Newsgroup: comp.sys.atari.st
Date: 1993-03-19 12:50:04 UTC
From: ga@mrih.no
Message-ID: <1993Mar19.125004.403@ugle.unit.no>
Source record: 208516
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have a M4STE. In it was two D27C010's which made out the 256 kB of TOS 2.05.
I then got a set of AM27C010's to burn TOS 2.06 on. Well, 27C010 should be
27C010, I guess, but alas... no... When I inserted the newly burnt EPROMs,
I got the normal startup, with the exception that instead of the Atari logo,
I get the correctly size box, but a lot of crap in it... takes a while, and
I then get three bombs before it resets and starts all over again.
After having resetted 34 times, it manages to load the bootsector, on which I
have put a TOS loader, which uses BIOS to load the file, as GEMDOS does not
work... Now, if we divide the ROM in four 64 kB blocks, A, B, C and D, instead
of having them in the sequence ABCD, I discover I have ABBB.
Moving two of the straps gave me the combination ABAB, but C and D still is
not to be found. Clues, anyone?

Please answer by email, as I'm not on this group often enough to keep up with
everything... Especially now...

I've never seen this IBM-Drive before, but one probable solution is, to
dig out (of the owner/user-manual) how to set up the logical- and unit
number. I heard of a problem concerning this. For the reason of
AHDI-compatibility the logical-drive number has to be set to zero.

Hi,

I own a STFm which shouldn't be so far away from the architecture of
a STE. In my machine there are no slots for SIMMs.
So you will have to do some soldering if you want to add them to
your (machines) memory.

Source record: 208519

Yes, STe's have SIMM slots. 1x8 SIMMs will do. I just buy and install 1x9 70ns SIMMs because they are the most common and the cheapest (harder to find slower SIMMs). I retail them for $CDN 39 (about $US 30). To install in a 1040STe, remove the 7 screws from the bottom case and pop off the cover, remove the small sheet metal plate in the rear, left side of the RF shielding, pop out the 256K SIMMs (little plastic tab holds them in place), pop in the 1 meg babies and close upt the system. Whole operation takes about 5 minutes. Next, run your system. No configuration required; the extra mem is recognized automatically (an PC users reading this - take note!, no CMOS set up required!!!!!)

Source record: 208522

Okay, we've heard a lot of plus points for Data Diet, and a lot of minus points (well, one or two!) and what I'd like to know is exactly how it works.....

Does it use the exact same method as Stacker, as in use a normal partition which has all the necessary boot up stuff, including the Data Diet driver. And each subsequent partition that you want compressed has one BIG file one it that is a compressed version of what the user thinks is on the drive. I assume that the Stacker driver then intercepts any READ or WRITE requests and uncompresses the necessary parts from the large compressed file.

I have quite a bit of experience with Stacker, and can say that it hasn't caused any problems on the four machines that I've used (the four people I share a house with, all have Stacker - and yeah I know, house full of 486s with me with my little STe)

Anyway, anybody got any ideas?

Also, is Data Diet available in England, from an English supplier preferably.

Does anybody in the UK have it?

Hope someone can help, cheers.....

Truce?????

Wake up, this is 1993. Atari is D*E*A*D. Yeah, they got the Falcon. So what? The Archimedes is better than all of the opposition (Amiga incl) in the same price range. They still sell in veeery moderate numbers. So will the Falcon. Its user base (old ST fans) won't shift to the Falcon bcoz of huge compatibility problems. So not for the Amiga, the Amiga evolves without major comptability probs. So, the enemy is no longer Atari. It is as pointed out the PC things and Mackintosh things. These are firmly placed in their fields. But time is running out for such old system. It's really up to C= strategyst now (oh lord, noooooo.....). When PCs and Macs die of old age, a firmly placed machine must be there to take their place. This must be C= goal!

-Roy

>try this at home, kids. 8^}

GET REAL BUDDY!!!
(I took it for granted that everyone who has ever owned a computer knows
not disconnects anything except joysticks etc.)
I have one ST(2.5 MB) with a hard disk upstairs and one without downstairs
(1 MB). If I want to do something on the one downstairs (ie use
modem,play empire, or try out one of my new programs (assembly) on a TOS 1.0
machine) I'll copy whatever I need onto my polydisk along with whatever
utilities/accesories I might need and simply take the
polydisk downstairs and boot it FAST!!!! without a floppy (Note: it is
better to have a disk in the drive as one of the first things the comp
does is check the boot sector...)
. Much easier than lugging a bunch of
floppies; ussually you dont have everything you are going to use on one
floppy.
And OF COURSE you never unplug anything without the computer on!!
(GRRRRRRRRR :))

>groff 1.07 has been ported to the Atari ST and MiNT.
>I have uploaded it to atari.archive and sol.cs.ruu.nl last week,
^^^ we prefer ftp.cs.ruu.nl

It is now available at ftp.cs.ruu.nl !!

We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get 'GROFF' via anonymous FTP:

Site: ftp.cs.ruu.nl [131.211.80.17]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
file: /pub/ATARI-ST/gnu/groffbin.zoo
/pub/ATARI-ST/gnu/groffvar.zoo

--> How to get 'GROFF' via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.

| Please use a VALID DOMAIN ADDRESS.
| Use 'hip!hop!user' if you must.
| Never use an address which has both '!' and '@' in it.
| Bitnetters use user@host.bitnet

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!sun4nl!ruuinf!mail-server

begin
path fred_flintstone@stone.age.edu (SUBSTITUTE _YOUR_ ADDRESS)
send ATARI-ST/gnu/groffbin.zoo
send ATARI-ST/gnu/groffvar.zoo
end

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:

send HELP

A complete "ls-lR" listing of the archive is kept in the top-level
directory, it will be updated every night. To get it, issue the command:

send ls-lR.Z

That's all for now. If you encounter problems using the FTP service
and/or the mail-server, feel free to drop me a line (by e-mail, please).

4394. Tools for Sampling Sound Output?

Newsgroup: comp.sys.atari.st
Date: 1993-03-19 16:22:15 UTC
From: vogt@cipserv1.physik.uni-ulm.de
Message-ID: <vogt.6@cipserv1.physik.uni-ulm.de>
Source record: 208529

Hi, there!

I've just got one question, and _for sure_ out there is one of you able & willing to answer it, yes?

I do my programming mostly with GfA-Basic V 3.0, and I'd really _love_ to introduce some sampled sounds into my programs (copied from games or muzac programs). Yet the question is, how to play these samples?
Of course there are numerous Accessories to use, but I've found none, which I could call from my running Basic-program. So I ask whether there are any tools available that can play sampled sounds and being called from my programs? (If they do it in interrupt- the better!)
Or is there any C- or machine-code-freak that has written a simple routine he'd give me a copy of...? (GfA is able to include compiled C-codes as well as machine-code-programs.)
And, please: I'm not too experienced with the ST sound chip, so keep your explanations on a low level, okay? Thanks.

P.S.: I know that there is some BIOS-routine which is able to play whole songs in interrupt, but as I can recall, this routine is unable to deal with sampled sounds- or is there a trick?

Thank you in advance,

Ciao, Elmar

While there might always been some rough stuff between Amigas and
Ataris, I admit the Falcon is very nice for a lot of stuff. So yes,
I think both machines deserve to be recognized.

I might add that the Amiga in some degrees already is (video market),
but definitvely needs much more.

They are the first company to design a machine from the ground up that has
support for MS-DOS and Mac applications. Add on hardware doesn't count.
If it did my NeXT would also be on the list with SoftPC and Executor. Not
to mention X11 and of course NeXTSTEP.

The point is that once of NuTek's products has both an Intel and Moto
processor on the motherboard. They are the first to marry the architectures
on a system level w/out an add in card.

>ST, for
>that matter) and they'd just as soon keep it that way.

I think they know who they can try to sue and who they can't. There is
nothing
that you can do about someone using legal roms in an Amiga, Atari, etc.
You
can write software (ROMS) then restrict what a person can run the
software on.
It's like IBM saying that you can't run OS/2 on anything but their
hardware.
This doesn't have an ice cube's chance in hell of holding up in court.

Also they haven't sued the developers of Executor for the NeXT since they used
a clean room approach like NuTek.

[stuff deleted]
>Is there any disadvantages in using disk caches? I heard something
>that they can sometimes ruin your FAT if the electricity suddenly
>"stops", I don't know the exact word for it.

In terms of safety, I would say that READ-ONLY caches are probably SAFE (since it's just taking the place of READING from the hard drive, i.e. no disk modifications are going on).

However, I would personally (and I do) avoid WRITE caches - if there is information in the write cache (i.e. a disk modification should take place) and the power goes out, then that modification is lost, and what modifications should have been done to the disk (FAT entry, etc) has not happened...

It may be a little conservative of me to avoid write caches because of this, but a little safety to me outweighs the problems that could be caused...

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...besides, if I'm using something that does alot of writes (like using a compression program, etc) then I'd just do it on a RAM disk - the speed increase would be there, and if power was lost, my physical media (hard disk) would not have the possibility of being correupted...

4398. music on TT ?

Newsgroup: comp.sys.atari.st
Date: 1993-03-19 18:00:26 UTC
From: robillia@lifl.fr
Message-ID: <1od1nqINNplg@netserver.univ-lille1.fr>
Source record: 208536

Can someone advise me about a software/hardware for creating music on Atari TT ?
I would need the following possibilities:

- recording sounds from non-midi sources
- playing rythm (battery,...)
- mixing
- output to standard tape recorder

I have heard about Music Master and HMS soundtracker, but I'm not sure about the real capacities of these programs (and do they run on a TT ?).

Any advice is wellcome...

DR.

|> +---+

Yes, it IS a nice machine, but, like everything it seems, it has one or two nasty flaws (Don't blame me for these. They come from an A5000 (This is an Archimedes in all but name. Note the similarity to the Amiga naming system...) owner...).
16 Mb maximum memory limit (under RISCOS)
256 colour mode derives all colours from ONLY 16 REGISTERS
Screen memory limited to 512k (This is equiv. to Amiga CHIP RAM)
No pre-emptive multitasking
Some nasty features left over from the BBC micro.

Don't take this to mean I don't like it. I think it's probably the only current real competitor to the Amiga in terms of ease of use/design elegance in a home-computer situation (The Falcon may prove to be in the future, but at the moment it doesn't count for much...).

Robert Brown.

(Sorry for keeping this in the ST group, but I think it's still (JUST) of general interest. Anyone following up, check the subject-matter, and change the newsgroups accordingly... (Maybe to comp.sys.acorn?))

^^^^^^^^^^^^

Hmmm, wouldn't say that. The Arc is quite a nice machine, but it does have some serious shortcommings. How would you like a large amount of your OS based around a BASIC interpreter in ROM? It also has serious difficulty running UNIX, due to the way it's MMU works I believe. They have only co-operative multitasking (I think most would agree that pre-emptive is the better way to implement a multitasking OS)

As for speed, can't speak for the ST, but my '020 based 1200 seems to be slightly faster in general use than an ARM2 based Archimedes, and an A4000 is certainly faster than an ARM3 Arc.

|> Its user base (old ST fans) won't shift to the Falcon bcoz of huge

|> -Roy

Have to agree on this point. Time may be starting to run out for the PC. I have heard that Intel is having serious difficulty mass producing the Pentium (this may not be true, just what I have heard), and with IBM and Apple teaming up on PowerPC, hopefully the days of 80x86 boxes are numbered. We could end up with a highly fragmented market in a few years, just like in the early 80's and this IMHO would be good for the computer industry as a whole, because it would encourage competition and innovation.

Chris Brown

Not the first to clone the ROMs, no. In fact, I'm running Executor on the
NeXT on my desk right now. No Mac ROMs involved
. .
>

Interesting. Executor (by ARDI, built on top of their 60,000 C line ROMlib
package) runs Excel just fine. It is still a bit unstable, without color or
System 7, or... Still, it's quite an impressive achievement.

Joe

In article <1ob3qdINN271@phakt.usc.edu> baffoni@phakt.usc.edu (Juxtaposer) writes:
> Sorry if this has already been discussed, but just what is the copper
>for (sounds like something from a bad 20's-era movie).
> Is it some sort of graphics coprocessor?

Basically. Its a display list processor that runs small programs which
define and manage the display. THe Copper can access any of the custom
chip registers (including the ones controlling itself) on the Amiga. A
copper "program" basically consists of a list of MOVE,WAIT or SKIP
instructions. MOVE just moves a value into a custom chip register. WAIT
waits for a certain scanline and horizontal position, and I forget the
exact mechanics of SKIP. But I'm sure someone will enlighten me before I
have a chance to go home and look at the hardware manual. :-)

The copper "program" is restarted every VBlank. A typical "copper list"
for an Amiga display would do something like the following:
(THis is in a very generalized form.. the actual list would be several
MOVE's for each type of operation)

```
MOVE display type, reg
MOVE dimensions, reg
MOVE colors, reg
MOVE address, reg
WAIT forever
```

of course, by putting something like this before the "WAIT forever"

```
WAIT scanline 100
MOVE display type,reg
MOVE colors, reg
MOVE address,reg
```

you can have two sections of differing resolution and colors on the
same screen. The copper can also control other custom regs such as the
blitter..etc. The copper can also cause interrupts. So basically its
a very easy way of syncronizing to the display. Keep in mind that the
Copper runs concurrently to everything else in the system as well (hence
the ability to cause interrupts).

I have an Atari St computer system for sale. I will sell it either in
pieces or as one big package. Here is what I have:

Hardware
========
Atari Mega ST4 Computer (w/ TOS 1.4, Mega STe keyboard,
and GoldenImage mouse) $475
Mitsubshi MultiSync Monitor (w/ Atari ST interface mouse) $375
Amplified Stereo Adaptor $30
2 TAC30 Joysticks $25

Software
========
Calamus 1.09 $90
WordPerfect 4.1 $80
GFA Draft Plus $15
IBM DOS 3.3 (for IBM emulators) $15
Ultima IV $25
Planetarium $25
GFA Basic 2.0 and 3.0 w/ ref manual $70
UltraScript $70
BBS Express! ST 1.79 $70
==
Total $1365

Entire Package (-10%) $1230

These prices do not include shipping. If you are interested, I (Chuck)
can be reached at:

509-235-8746 (voice),

I'm pretty sure there's a PD spectrum emulator around for the Atari - try atari.archive. If you can transfer these programs there may be some interest from others who can't! - I remember the days of Manic Miner and Atic Atac.....

Keith.

In a previous article, Bob_BobR_Retelle@cup.portal.com () says:

>Yes, I should have made it more clear.. it's for machines other
>than the Falcons with 4 Megs or more that Multi-TOS will be
>sold separately.
>
>I'll check again with John Townsend about AtariWorks if I can catch
>him before he leaves.. as of earlier this week, he's resigned from Atari.
>

Are you kidding? Why did he resign????

>My impression from what he'd said was that AtariWorks was going to be a
>separate product.
>

From my impressions, AtariWorks is going to be on ALL hard drives that
Atari sells, including the ones in the Falcons.

The Atari Works will also sell in a separate package.

Dave can't get sued for Spectre for a very simple reason. The hardware
he designed is simply a place for the ST to read in information off of
a ROM and a GCR disk controller.

The same holds true for many of the AMIGA boards, etc.

The idea being that you could buy the Mac ROMs (the essence of Mac) and
slap them in the hardware "adapters". You can't be sued for making a
device that reads information off of ROMs.

The software that comes with these devices loads in the code and
monitors instructions being executed by the ROMs and other software
By doing this the software can make it seem that the chips inside
the current computer are like those in the computer you're emulating.

Same thing here, you can't be sued for making software that makes some
chips acts like others. That alone doesn't give you a Mac. The board
alone doesn't give you a Mac. So long as the person who makes the board
doesn't try to make the Mac Roms there's not a darned thing Apple can do.

Now the NeTek computer is a different story. The problem here is that
you have to ask:

"A new (but closely matching) product or a very ingenious way of
copying?"

Frankly, if NuTek consulted with lawyers and really did do a total
ground up "reverse engineer" (given a final outcome can you produce a
machine that produces that outcome. Rather than can you produce a machine
and with the hope that it produces some kind of outcome. Well...you get
the idea.) which would be extraordinaryly difficult, I don't see how
Apple can do much. If NuTek never looked at the Mac ROM code then there's
nothing that can be done.

But that's the main difference between the NuTek computer and emulators
like Spectre. Many people have asked about this in the past so I figured
I post on it.

By the time Atari Works is shrink wrapped, Claris well have moved on Wi
By the time Atari Works is shrink wrapped, Claris will have moved on with
Claris Works 2.0

Why is it that Atari plays catch up? I can't believe that Atari users are
bitching and moaning because they have to pay for the multi tos upgrade.

Now for the Jaguar. Atari must have ilusions if they think they are going to
sell the Jaguar in reasonable numbers without marketing it. Look at the Lynx.
I have one and should of been a better seller than the lame boy.

The reality is that Atari is on life support and is bleeding. I don't know if
I would spend $1300 on a Falcon. For the same price I can get A Mac LCIII
4/160 or a Centris 610. Hell you can get an Amiga 3000. An Amiga 1200 with
two megs and an 80 meger can be had for $850.00. The new Amiga 4000/030 will
be in the same price range as the Falcon and this machine has slots.
Oh yea...Sears catalog is selling the Mac Performa 400 with Claris Works for
about $900. Yet Apple has better support policies.

The Falcon comes with a 16 mhz 030 that can not be upgraded. Who wants to
invest in a product that does not have an upgraded processor.

Lets face it. You can flame me, i dont care. The mac with cdrom cant be beat
yet. The quality of the cdrom titles are awesome. Apple is moving ahead and
hardware prices are falling by the month. Hopefuly the new Amigas with CDROMS
will shake things up......

>|> per frame or something...
>
>I believe this is the rate at which AGA can swap screens, and therefore each
>frame can be completely different from the last. (Even resoloution, palette etc.)
>
>Chris Brown

Let us make some assumptions:

* Your monitor has a refresh rate of 72 hz (that is 72 cycles per second for
those of you that don't know... not a flame just information)
* you are doing the _most complex_ animation possible... every pixel
changes with each screen flip.
* we are using Raist's screen size 1280x400
* we are using 4 bit color (16 total colors)
(I know it is not really animated, but the pixels are changing just like
Chris says above)

Now what we do know...

+ the screen has 512 000 pixels
+ if every pixel is a different color we could have a maximum amount of
information of 2 048 000 bits
+ if the screen was to change once per second the data rate would be
256 kilobytes per second
+ if the screen was to change 200 times per second the data rate would be
5.12 megabytes per second
+ If the screen was to change 2000 times per second the data rate would be
51.2 megabytes per second

now what I think....

- the monitor can't even keep up with 2000 frames per second because the
refresh is only 72 frames per second
- can the 68030 processor actually deal with 51.2 megabytes per second,
probably not...

- I think someone, somewhere has some numbers drastically wrong

now I may have my logic wrong and if I am wrong so be it, but until someone shows me how it should really be calculated then I will stand with the above numbers... which emans the amiga _cannot_ do animation at 2000 frames per second (why would you want to anyway?_

**note the numbers are extreme, but that would show what the system would be capable of at the top end...

In article <1oc2q0Ebu@uni-erlangen.de> mppi76@cd4680fs.rrze.uni-erlangen.de (Harald Schoenfeld) writes:
>aa399@cleveland.Freenet.Edu (Len Stys) writes:

>Really? Just sum up all the part only the Falcon has...
>- 16 bit Sound - no other computer you mentioned has that at all.

This is the true strenth of the Falcon. But note, not everyone needs 16-bit sound (Though we all *like* to have it).

>- true Color: show me a Mac for the price having 32000 colors

The LC III is in the price range of a Falcon 4/65 (and try to use 32000 colors with less). The LC III VRAM can be expanded (for <$99, actually $59 (retail) I think.) to be able to display 16-bit color. And that's not buying a video card...just a simm for the video memory.

>- SCSI 2: Not sure the Amiga has it for long

The other good point of the Falcon.

>- LAN: No Amiga has it

(Just ignore the Mac which has had this standard for a loooong time.) There's also the painful problem of finding "industry" standard networking to go *out* of that port. There are existing Atari network products but I don't really see them as intergrated as Appletalk is on the Mac. Nor are there solutions to connect them to other types of networks.

>- Midi: Non, but ATARI at all

Again, not everyone wants midi. For those who do though, it's nice not to have to chunk down more for another dangling piece of equipment! (But these are usually the same people who want the 16-bit sound). The only person (even counting computer techies) who wasn't an 'atari' person who knew what a Falcon was, was also a muscian. Coincidence? I don't think so.

>- DSP: Non, but ATARI

And soon to be Mac/Amiga but for a *far* greater price. For the mac probably >$1000. But then those macs have lots more in them as well.

There was a certain American government agency which bought a fair number of black workstations becasue they had nice access to a Motorola DSP. Now that company no longer makes hardware...and I think the Falcon access to the DSP might actually be cleaner than the NeXT version (esp. if you compare pre-3.0). The Falcon certainly comes standard with more DSP memory than the NeXT (moment of silence) did.

>- Video and RF: Important for many things: No MAC has it

Ignore the Amiga who has had this for years. (Just to keep this even.)
I'm not quite sure on the Mac-world status on this. I think you have to
go with crappy cheap solutions or $expensive$ solutions that do more than
most people want.

The ability to *not* buy a monitor might be all people need to purchase
a Falcon/Amiga over Mac. (I just don't like using a computer off the
TV, the interlace kills me.)

I hope I have been objective. It's not my intent to start a flame war,
but to keep up the informative comparison of equally priced macs/amigas/
and ataris. Each has it's own merits, and everybody who buys a
computer is looking out for what *they* want, therefore only the buyer
knows what is *really* important.

```
] P.S.: I know that there is some BIOS-routine which is able to play
] whole songs in interrupt, but as I can recall, this routine
] is unable to deal with sampled sounds- or is there a trick?

I'm not sure about 3.0. But GFA-basic 3.5E has a command to play
samples through STE DMA. (DMAPLAY I think..... gets manual....)

DMASOUND [beginning of sample data],[end of sample data],[rate]

Rate is:/

0 = 6.25Khz
1 = 12.5Khz
2 = 25Khz
3 = 50Khz

there is also the DMACONTROL command which comtrols whether the sound
is 0 = stopped, 1 = played once, or 2 = played in loop!
```

From: erlingh@storlind.idt.unit.no
Message-ID: <ERLINGH.93Mar20050118@storlind.idt.unit.no>
Source record: 208460

Strange.

We had two TT's hooked together over the modem2 port at 38.4k baud and
didn't have trouble at all.

Both TT's were running TOS 3.06 and had no patches for the serial-port.
We got a thruput at about 3400 bytes/s.

Are you sure your cable has all the signals ? (RTS/CTS)

Do you realy buy all this, this sounds like the drible that we were
fed for 3 years on the FSMGDOS program and CD roms...

They probably don't have the money to buy the parts for the Facon..:-).

For one thing the Falcon will never ever sell here..

They are selling here now Amiga A1200hd for $1500nz, the Falcon hd will be
over $3000nz, a 386DX can be brought for some $2000nz complete with monitor,
the other machines are not with monitor..

Also we have no Atari dealer chain left here...

Facts man just the facts...

Hi info junkies ......

There has been a BIG delay in releasing last weeks Z*NET due to this site being upgraded.

I hope to have them all posted either tonight or in the morning.

Ah the problems when your software becomes redundent (sigh). We have installed a full blown unix site here this week and it has taken a bit longer than I thought (what is *nix, Mr Small says) so all the Z*NETs will start flowing when telnet is installed tonight.

reagrds

4429. Manual Mark Bad - Possible?

Newsgroup: comp.sys.atari.st
Date: 1993-03-20 07:05:50 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.5SNEyMqKfx_@elfhaven.ersys.edmonton.ab.ca>
Source record: 208465

Hi!

I have a question about marking bad sectors on my hard drive. There is a sector on the drive that is bad. This is, beyond a shadow of a doubt, a fact. Anything that happens to get written to that sector never gets read back again. It's like a black hole! Now, Markbad (in the Atari Hard Drive Utilities package) refuses to acknowledge that there is a problem. It says everything is fine.

So, is there any way I can manually mark the sector as bad? (Perhaps using a sector editor?)

This is not an URGENT problem, but since the sector is on my UUCP partition, it worries me. If something important gets muddled because of this problem, I would be less than pleased with my hard drive...:)

>1350 US
>
>US$1350 is roughly what the 4M/65M Falcon was anyway wasn't it!?
>(Something like $1299) - anyone!?

But Steven you forget the high retail markups here plus the shipping and handling from OZZ, you will find that it will be more like 3-4 * the UK Price, like the STE and other machines were, so that will be more like $2800 for the HD Falcon at least.

Note you can buy the Amiga A1200hd for some $1500 NOW, the basic A1200 is not being sold here...

Never mind its far cheaper here to buy a PC clone...

Well, Erland and Steve, I was going to keep this to private
E-Mail, but since you insist on another flamewar..

I invite you to quote me back any "false rumors" I've posted here
at any time in the past...

Not any "everyone knows" kind of thing, but specific examples..

If I've ever made an error, and that hasn't been very often, I've
posted a public correction and apology...

So.. let's hear some specific examples if you can.. or..
an apology from YOU, if you can't..

BobR

(You might not like what you hear, but that doesn't in of itself
make it a "false rumor"...)

4432. Re: Eagle030 ?

By the way, Erland.. .what exactly IS my "reputation" here..??

I post the truth.. something you might not want to hear, but
well, that's just too bad...

I refuse to jump on the "Jack Tramiel is GOD" bandwagon, and the
"Atari Corp can do no wrong" religion likewise holds no
particular attraction for me...

My Atari 520ST computer is in use every day, in fact, it's never
turned off... I use it in preference to the IBM systems I have
right next to it...

But I refuse to lie to anyone about the company that pretends to
support it, and which has completely thrown away any chance for
it to become a seriously recognized competitor in the world
computer marketplace like it *should* have been.

In this case, John Townsend indicated that AtariWorks would be
sold as a separate product. I've asked Dan MacNamee to clarify
the situation... if it turns out I was wrong, I'll post that
information (and an apology) publicly..

If I have a "reputation here", I'd hope it was one of telling the
truth about Atari, even if that truth isn't the "Politically
Correct" thing... so what's YOUR interpretation, Erland...?

>...Have to agree on this point. Time may be starting to run out for the PC. I have

heard that Intel is having serious difficulty mass producing the Pentium (this

may not be true, just what I have heard), and with IBM and Apple teaming up on

PowerPC, hopefully the days of 80x86 boxes are numbered. We could end up with a

highly fragmented market in a few years, just like in the early 80's and this

IMHO would be good for the computer industry as a whole, because it would

encourage competition and innovation...<

Say What????? Time is runnign out for PCs? Where did that idea come from?
I mean the fragmented market and everything probably has some truth in
it, but PCs dying? *NOT*.

O.K. Intel just hosted a conference about its Pentium Chip
here at the University of Mihcigan Ann Arbor a few days ago.
They are going to introduce the Pentium by next week (May 25th).
They also explained about the technical details about the chip.
In short, if one of you had been to the talk, I think you
would reconsider posting such a ridiculous theory.
Here is the real scenario:

Pentium and Alpha chips are going to RULE the 90's.
Hard performance numbers/installed user base and
professional magazines will confirm this.
The Mac is going to be there with Totally different OS.
Unix is going to be more specialized machines.
I would be really surprized if AMIGAs were still
around, say 1996. (Well, I have to admit that this is also too
far fetched.)

Anyway, I have enough techincal details of both Pentium and
Alpha chips from reliable sources to support my theory.
(I have two friends takling a microprocessor design course
at the U. of M. They are mainly studying the Alphs AXP
architecture among others)

I realize that all AMIGA owners wish that the AMIGAs become
a major PC platform. But the idea of PCs dying is just a
wishfull thinking, IMHO.

****WAKE UP!!!!!!!!!****

I hope I did not actually bash AMIGAs themselves.
I got nothing against AMIGAs. Those of you
who saw my posting "Advise needed in setting up a AMIGA ..."
would know. I really like reading this news group.
So, if you want to argue with me, please provide supporting
evidence.

Me too. It's just a pity that none of the emulators I've seen (Amiga/ST/PC) actually manage to get anything approaching spectrum speed. Sad, isn't it? Maybe somebody ought to do a Z80-on-a-card emulator... I'd definitely buy an Amiga version, and I know of several other people who would, too.

(And don't forget Knightlore and the Magic Knight games...)

Robert Brown.

Um, no, it means that the Amiga can't do animation at 2000 fps in full-screen superhires double-pal (the mode you described). On the other hand, how many 1280x512 MPEG movies have you seen? Anyway, the point is that you don't have to move any bytes around at all... All you need to do is tell the computer to read the screen display from a new address... This technique is known as page-flipping and can be done with virtually no loss of processor time (should run in the vertical blank, and just needs to move a longword somewhere...) The problem is, of course, that you have to have all the frames in memory (or a damn fast loader/decompression routine), but what it's saying is that if you had a monitor that had a frame rate of 200 fps, the Amiga would be able to animate at that speed.

3rd party support. While technically the ST/STe/TT series "can't" be
upgraded, it has been by 3rd party support. The SST030 by Gadgets by Small
and Jim allen's Tiny Turbo 030, T25, etc both push the series to things
such as a 25mhz 68000, and I think a 50mhz 030 (Turbo030 if I'm correct).

No doubt similar products will be available for the Falcon (which should
be a little easier for the 3rd parties, with the Processor Direct slot)...

You have it wrong.... The amiga doesn't have to transfer ANY data to do an
animation, it just has to point the graphics chips towards a new ram area
in each frame.

If you think about it, vertically scrolling the screen down one pixel
corresponds to changing _every_ pixel on the screen, but all you do is
point the graphics chips to the next line of data from the top of the
screen the screen automagically moves.

I have a peculiar problem which seems to keep croppping up on my Mega ST4.

I've heard that the power-supplies on these have a tendency to go bad, am I hold it as the main suspect; however, my technical experience is _very_ klimited, so any advice would be appreciated.

The Problem/Sutuation

I (currently) have no Hard-drive. I regularly use a 1.7MB Ram Disk. The problem is that every so often, when booting, when the RamDisk tries to install itself, it fails and comes back with a "Sorry -- Not ERnough Memory" error.

This usually (but not always) manifestes itself after I've had the computer on for a while already and am re-booting. Turning the computer off for a while usually (but not always) seems to cure the problem.

Could i say, definately, that the weak power-supply is the problem?

-Matt

>>What would prevent existing emulation products from incorporating NuTek
>>technology?

>Copyrights and patents.

The point is, if NuTek want to make the Mac clones prevalent, they could license the technology to provide hardware emulation on a card. Prospective Mac owners will have a difficult time buying a Mac clone in existing markets, but those opting for emulation would be quite content to pay for an item that fulfills its purpose. If it walks like a duck...

[> paetau@mits.mdata.fi (Rasmus Paetau) writes:

[what is the best cache program for the ST system?]

TCache is the best, without question.

It is public domain, and EVERY feature can be configured. One of the
things I do with my system is run Hermes UUCP, a very file-intensive
Internet news and mail system. With TCache, the cache 'hits' 92%
of the time. 92%! Not only that, if you enable the write-through
cache (which I do) you can save immense ammounts of time in certain
situations. For example, when I delete my old news messages there are
usually about 2000-2500 files to delete. Without TCache, it takes around
8-10 minutes. With Tcache, it takes about 30-45 SECONDS. (This is because
the FAT only gets written a few times instead of once after every file is
deleted.)

I've used a lot of Cache programs, but Tcache is the best one I have ever
seen. There are some drawbacks, though; it is in German, and some software
like Gemini does not work with it at all. Be *very* sure that everything is
running fine (and will stay that way) before you enable the write-through
cache. If the system bombs while writing, or immediately after writing,
BAD things can happen. Very bad.

>and what modifications should have been done to the disk (FAT entry, etc)
>has not happened...

IMHO this is silly. Take two situations where you are writing small blocks to your hard disk (eg deleting files, copying from floppy, compiling, in fact most of what you do with your hard disk).
a) Using ICD's disk cache. All the data is written to the cache and then 2 seconds later it is written to the disk. The total time taken (Processing + writes + 2 seconds to flush) is, say, 30 + 0 + 2. A power supply interruption within the first 30 seconds will result in the loss of data on the hard disk. An interruption in the last 2 seconds will also lose data, but also risks a head crash.
b) Without a cache. The total time taken (Processing + writes) is say, 30 + 15. A power supply interruption within this 45 seconds will result in the loss of data and quite possibly a head crash.

As you can see the chances of losing data with ICD's disk cache is in fact LESS than that without because the operation is over quicker. The chances of there being a head crash is far less using the disk cache (and if I was paranoid, this is what I would be worrying about).

In addition there is little reason for paranoia about power failures which occur on average once every two years and even then 90% of the time during high winds, electrical storms, or when the company had already told you it was going to be switched off for maintainance work, when you should have the common sense not to use the computer.
If you live in an area where the electricity fails often (like I used to), the chances of it failing when writing to hard disk are still very low (it never happened to me), and for the determinedly paranoid a small UPS can be

bought for 50 pounds.

I recommend you use ICD's caching HD driver software and use the time you save to make extra backups.

>> provides a good kit of utilities and options too. Neat soft...

The problem with Data-Diet is that every time you open a dietized file, it decompresses the whole damned thing to disk, a real pain if, for example, it's the sort of file you _really_ want compressed, like the fidonet nodelist, which in compiled for is around 2.5M in length.

s> I have data-diet also, I compacted all of the data files (this is what
s> data diet does, they have another utility called Squishem or something
s> that compacts executables) and then I went to use my system.... to get

s> and I had to reformat the HD. I have heard from many people including
s> the Codeheads that this has happened frequently.... but I have also heard
s> that alot of people like it...

What you probably did was set it to 'dietize everything', right?? A truly braindead feature that is, because it will dietize your harddisk driver. Not a difficult problem to fix, once you know how your system works, but a real challenge to the average Luser.

s> Instead of using the program i bought another HD, Toad computers has a
s> good deal for drives for the TT, I bought a 130 meg for 399 dollars! It
s> is much better than a disk compaction program...

Have to agree there. I wouldn't trust one of them as far as I could kick it -just wait and save and scrounge up all the disk you can find... 8)

To be more specific, here in Ottawa I saw a mac LCIII 4/80 going for a little below $2200 (Canadian funds). I recently saw a message claiming that the LCIII is in the falcon's price range. Well that certainly is not true here in Ottawa unless the price of the falcon suddenly sky-rockets to $2200. Mac's always have/are/will be WAYYYYY to expensive (for me at least:)

(Note: The falcon has not landed here yet so it is theoretically possible that the Falcon prices will rise...)

>Unix is going to be more specialized machines.
>I would be really surprized if AMIGAs were still
>around, say 1996. (Well, I have to admit that this is also too
>far fetched.)

Lets try to be reasonable here. The motorolla 68060 will very
likely be much better than the P5 therefore almost any machine will be
better than a P5 PC if it incorporates a M 68060. The point is the P5 will
have absolutely no effect on how much better/ worse it does in the next
couple of years since the competition is coming out with technology at at
least the same level as Intel PC's. The battle will be decided by by
marketing strategies of competing computer manufacturers.
THIS IS NOT A FLAME. I'm just trying to start an Interesting discussion

Oh yeah, I don't really like Amigas but I certainly think they will be
around in 1996 (As will ATARI)

> Tandy a tinkle...]

You can bet a lot of ad copy was left on the cutting room floor!
What they 'forgot' to mention about the A1200 was this:--

Twitchy and skewed video displays with disappearing sprites,
dodgy floppy drives, crappy modulators, spastic A600 power
supplies instead of a proper A1200 model, squeaking mice
and a dyslexic keyboard that can't get it straight from
your fingers. And a HAM8 256,000 colours feature that
turns out to be a bunch of bollocks. It is more like
25,000 colours, if you're lucky with the picture. My
friends with PCs even pointed out that any standard VGA
card can be fitted with a cheap Edsun Labs CEG video DAC
to accomplish the same thing (3:1 picture compression with
'256,000' colours). Innovative HAM8 indeed!

Anyway after returning the third replacement, I got smart
and dumped the A1200 for good to save up for a better Acorn.
No wonder developers are leaving in droves and predicting
Amiga's demise in six months. You =cannot= fool the people
forever, Commodore.

>I use Gem Zmodem from Michael Ziegler, Connect 1.95 and a ZyXEL 1496E 5.04
>modem, in case you should know of some troubles with that combination.

i hunted for that one for some time too (me: mega STe, uucp on modem2,
corrupted files and no protocol errors), and finally found out its a
hardware problem :-(seems whenever the SCC chip (controls modem2 and
serial2, $ffff8c8x) gets accessed during disk IO theres a chance that
this access trips over the disk DMA reading/writing memory and then you
get corrupted data sent either to/from the disk(!), or the port, or
both. and the chip is accessed in interrupt handlers whenever data goes
over the port or CTS changes...

i know of no real (hardware) fix for that (there is a patched GAL for
another bug concerning serial2, haven't tried that yet), the `solution'
i'm testing now ist to have the disk driver (actually cache program)
call a routine (cookie) that drops RTS and turns off SCC interrupts
before DMA and restart everything afterwards. that _seems_ to do it,
except the modem apparently ignores RTS until it has a connection
so uucico's dialer now sometimes misses modem messages and times out
when other processes use the disk...

hope it helps,
Juergen

PS: maybe it's not only mega STes... there was a report in one of the
maus. newsgroups about a falcon running a disk reorganize (chkdsk3)
that crashed horribly when the phone rang and the modem sent `RING'...
(falcons modem port is on SCC too.) poor guy had to clear out the disk

and reinstall everything...

Strange I had an acorn machine and just got rid of mine. If you are
so worried about the video I would advise against getting an acorn.
It only has 4 bit DACs for the video output and only 16 palette registers.
In general images in the 256 colour mode are dreadful on the acorn.
Sure the VIDC20 is better... but when will that make it into a machine?

>(well, one or two!) and what I'd like to know is exactly how it works.....

>Does it use the exact same method as Stacker, as in use a normal partition

No. Data Diet has a couple of different methods (you can freely choose
between them) but they are both basically the same. I'll try to outline
as best I can.

When you read a file, the file is copied to the work directory (set by
you, can be a RAM disk for speed). If the file was compressed, it is
uncompressed before copied to this directory. The rest of the reads on
that file are directed to read from the uncompressed copy of the file in
this work directory. When the file program you are using is quit (or if
you select FLUSH & DELETE from DD's accessory) the files in the work
directory are compressed and stored in their original locations.

When you write a file, pretty much the same as above occurs, except no
file is read and when you first create the file, a 'dummy' of the file (of
size 0 bytes) is created of the file in it's directory (for reasons that
are hard to explain). This dummy file is replaced by the compressed copy
of the file (immediately if you have "real-time mode" selected, when you
quit the program if you have "Quit" or something like that mode selected).

The main difference between DD and Stacker is DD's files are stored as
perfectly normal files on your hard disk, just the way TOS does. They are
just compressed. You can easily have DD not compress a certain directory,
files or partition if you want. You could, for example, compress all your
files except for your games. You could then boot your computer without
DD, and you'd still be able to play those games. I don't believe this
degree of flexibility is available with Stacker.

If you don't have DD installed, you can still see the files on the disk in
the usual manor, and you can still access them. BUT, if the files are DD
compressed and you try to view them, you'll, logically, see the compressed
image of the file (which isn't too helpful).

It is by this way that DD avoids the crashes and problems which Stacker so
often runs into.

>Also, is Data Diet available in England, from an English supplier preferably.

I'm not sure.

>Hope someone can help, cheers.......

You're right, the screen change assumes the image is already in video
memory, so if the amiga had 51.2mb of Chip mem, it could do it (I think).

Source record: 208369

I'm getting nothing but garbled crap for file and folder names on a partition of my hard drive, and can't run anything. All the other partitions are working fine. Can someone suggest a course of action for recovering files? Is there some recommended software that could help? What could the problem be, and what can be done to solve it? Ummm, there is no dealership within hundreds of miles of here so any software will have to be PD/shareware. Thanks for any help.

I've seen this add on the front of a Tandy store in Sydney. As
usual Atari has to resort to lies to sell thier machines! Ever since
the original debate between Amiga and ST started all I've ever heard
was blatent lies from people who try to sell the Atari.
All thats keeping Atari alive these days are the musicians
who want MIDI and QBASE and such.

Support for the Amiga is bad, but the support for the ST is worse,
support for the Acorn is NON EXISTANT!!

Have fun with your useless piece of hardware :-)

4476. Mega STE Problems

Newsgroup: comp.sys.atari.st
Date: 1993-03-22 03:56:16 UTC
From: psurge@cs.utexas.edu
Message-ID: <lqqe70INN2t9@levelland.cs.utexas.edu>
Source record: 208365

I have been having problems with my Mega STE lately. I have TOS 2.05, 4 Megs of 1X9 60ns Simms, no internal HD, no jumpered internal DMA (i.e, I cannot use my external drive right now). The machine is used, but I was assured by the seller (a dealer) that it was working fine.

The only thing I did to it was replace the 256K Simms with the current 1meg Simms.

Tuesday and Wednesday the machine worked fine. Hooked up to it was a printer and 2400 bps modem, as well as my color monitor. As the week progressed, the machine started crashing more and more. By Saturday night, I could not even get the machine to start up. All there were was red/black dots all over the screen, or sometimes a green field with red dots all over it. At first I suspected that the machine had trouble with no monitor hooked up (I was using a TV via the RF modulator). I hooked the monitor back up and still hadd the same problem. So I put the original memory back in, still the same problem. By some act of God, I have the machine running now and have been using it for the last 30 minutes with Uniterm. Other times, in any of the configurations (monitor, no monitor, 1 meg or 4 megs) if I got the computer to run it would eventually lock up. When I was using it before, it was without the printer and modem hooked up.

Like I said, this was a progressive thing: It worked fine, then started crashing. Then sometimes would not start up, but would eventually bomb if it did. It finally went to never starting up, back to starting and crashing.

In a late breaking development, I discovered that the 2400bps modem was leaking current. I found out when I was about to plug in the modem cable and got a big shock. I am currently using a different modem, and the faulty modem was used only once towards the beginning of this problem (but after the onset of symptoms).

I will be calling the dealer soon to ask about this, but if anyone has any ideas in the meantime, I would be glad to hear them.

Thanks,
Troy

I want to buy a hard drive about 100 mg. for my Mega ST4 that I can also use on the 486 PC clone I plan to buy in about two months.

Can this be done? What is the best way to go about it?

Completely analogous to the old ANTIC chip in the Atari 8-bit series.

I bought a hard disk from them once. It didn't work properly so I sent it back. I got jerked around by a guy on the phone for over a week so I eventually asked to speak the the MD (Brian Davies I think) and he sorted out the problem instantly and I think he may have blasted the errant employee too. I think that some good companies can be let down by some of their less conciencious employees.

> Support for the Amiga is bad, but the support for the ST is worse,
> support for the Acorn is NON EXISTANT!!

I really didn't want to get into this ATARI/Commodore war, but as these
Amiga gys keep posting to the ATARI group all the time, I would like to
at some points:

How about the A1000? The best machine of all Amigas was dropped a
short time after invention. Any support today? No. A friend of mine
had a lot of trouble in getting anything for that thing. Why? For example
Commodore mirrored one of the connetors...Typical.

How about the different types of A2000? If you are unlucky and got
one of the old A2000 you can just throw it away because nothing is the
same as with the second version... I know people with that problem.

If anybody calls this a better support than that of ATARI, I
really can't understand this. The only thing that is really better normally
is the marketing...

From: hack@cs.few.eur.nl
Message-ID: <1993Mar22.100150.23858@cs.few.eur.nl>
Source record: 208373

Hello,

I'm having some problems with my supercharger (version 1.4).
Some programs are running quite fine, but with others my atari hangs
after some time. Turbo pascal 3.0 is running fine but all the other
versions are instable. The same goes for Turbo-C, wordperfect 4.2,
ms-dos 4.0, etc...
Using the memory of the supercharger as a ramdisk under tos doesn't work
either. Compressing some files in the ramdisk gives (sometimes) a
corrupted archive.
Are there any persons having a supercharger who can run these programs
without crashing ?
Do I need a newer version of the software ?

Please email me some of your experiences,

Floris Hack
EMAIL : hack@cs.few.eur.nl

B.T.W.
what happened with the promised upgrades for the supercharger to
a 80286/80386SX/.. chip ?

A bit of caution is due here; I had ColdHardCache v3.5 (I think) and
liked it a lot, until I decided my TeX installation required >16 M
partition. Since then I got strange dissapearing files and folders. At
first I thought it was the 40-folder limit, but it turned out to be
the cache. It's in the docs somewhere that it doesn't support >16 M
partitions. That's a shame, since it really was a nice cache. So, now
I'm using cachennn by Atari themselves; it's not as fancy but it does
the job.

On second thoughts, it could also have been my disk defractioner that
caused the problems. However, for one reason or another I don't use
the cache anymore. I probably had my reasons for it :-)

This may be old news, but I'll post it anyway since I haven't read anything about it here on atari.st

The card speeds up the Falcon to be a 32 Mhz machine and has SIMM slots for up to 32 Meg low profile SIMMS. It also has a VME slot. The price is set to DM-1498,- I do not know how they make room for this. Maybe it is an external box or something, or maybe it all will fit inside. Let's see at CeBit .....

pf21@unix.brighton.ac.uk (Paul) writes:

>Is there a newer version than 1.2 of protracker st available ?
>I desperatly need the help option enabled.
Please tell us why. I use Protracker 1.2 and think it is the best
tracker program ever. Why? It runs on my monochrome PSG chip only
1040ST and recognizes when a file is not a protracker file. It is also
very simple, so I think it is ideal. Do you really need explanation on
the three buttons [load] [play] and [quit]???

4493. Falcon030 vs Amiga 4000?

Newsgroup: comp.sys.atari.st
Date: 1993-03-22 12:24:54 UTC
From: ga@mrih.no
Message-ID: <1993Mar22.122454.198@ugle.unit.no>
Source record: 208379

Now... don't flam ME for it, but a guy here thinks that comparing the F030 with
the A4000 is completely wrong, and that if we should compare CBM and Atari,
then try... F030 vs A4000 and he is not sure what the A1200 shoule be compared
to (something a little better than the MSTE?)
Anyone got enough info to put up a table of the technical data?

Bob_BobR_Retelle@cup.portal.com writes:

>By the way, Erland.. .what exactly IS my "reputation" here..??
Your reputation is one of posting ONLY negative information on this net and thereby instigating annoying flame-wars. By the way it is written Erlend. I am stupid to post a follow-up and hope that people that agree with me do not follow-up, but reply to you. And that people that do not agree mail to both you and me. That would be a lot less annoying to everyone.
>I post the truth.. something you might not want to hear, but
>well, that's just too bad...
If it really is the truth there should be no reason for confirmation. I do not claim that you always post rumors. Sometimes the information you post is not just a rumor but has been confirmed. Of course I do not say that this is something bad that you do.
>I refuse to jump on the "Jack Tramiel is GOD" bandwagon, and the
So do I. I do not know Jack Tramiel and therefore have no opinion of him. Maybe you know him and therefore have an opinion of him, I disaprove if that is enough reason for you to post some biased information to the net.
>"Atari Corp can do no wrong" religion likewise holds no
>particular attraction for me...
Again I agree. By the way, I don't think there are more than a handful of people that are followers of this religion. Therefore there should be no need to bother all of us with trys to convert us.
[BobR uses Atari]
Sure so do I. I never said you didn't. So you should not include this in a post!!! to attack me.
>But I refuse to lie to anyone about the company that pretends to
>support it, and which has completely thrown away any chance for
Well I am quite happy with the amount of support I get here in the Netherlands. Of course if you are unhappy with the amount of support you receive from atari america, tell them so, but don't bother atari users from other countrys with for them useless information. I would be very happy if you for example restricted the area of your post to e.g. America.
>it to become a seriously recognized competitor in the world
>computer marketplace like it *should* have been.
No opinion on that. I can only guess the reasons why the IBM PC has become the standard and not the Atari St, but then again I like many others am not very interested in such historical debates. We now have an atari and will use that computer so thats it.
>In this case, John Townsend indicated that AtariWorks would be
>sold as a separate product. I've asked Dan MacNamee to clarify

Well I think he is right. It was never said that Atari Works would not be available separately.
>the situation... if it turns out I was wrong, I'll post that
>information (and an apology) publicly..
If you would use the same policy as Atari does. That is only give information when it is available for sure. You may say they didn't do this before (e.g. Falcon) and there you are right. But for e.g. Atari Works Atari in the Netherlands adheres to this policy and will only give the information after the Cebit when AW is really available.
>truth about Atari, even if that truth isn't the "Politically
>Correct" thing... so what's YOUR interpretation, Erland...?
I hope the writings above have shown what my interpretation is. Politics has hopefully nothing to do with this.

have a nice day,

Erlend.

Another question:

Does anybody know of a good (i.e. effective and easy to use) sequencer that
works on a TT? I know Cubase 3.0 does but that is not really within my
financial range. Or will I have to keep my STE for music? That would be a
bit ironic, the price of the new TT taken into consideration...

thanks,

I'm not sure if Falcon prices have been released elsewhere yet , but
already it has upset quite a lot of people in the UK.

I buy several music technology magazines , and the music dealer adds
have been shouting for ages for people to order Falcons at the price of #499
sterling for a basic machine with 2mb RAM ....

Well , the official prices are now out , and the price of the base
Falcon has been set at #599 , with a 4mb spec coming in at 799 , and one with a
meagre hard-drive for #999.

The A1200 is currently selling for #349 through the mail order houses ,
with an 80Mb hard-drive model being retailed at around #599 ...

People expect the Falcon to compete with the A1200 ??? There's a hell of
a reccession in the UK at the moment (in case you hadn't noticed :-) , and I
suspect that a lot of ST users will be either looking at alternative upgrade
paths , or abandonment of Atari till the prices become realistic..

Sure , the Falcon has a 24-bit wide DSP , it has a high density drive ,
etc.. but we're still talking #599 as the foot-in-the-door price , a full #250
quid increase over the A1200 .....

Incidently , my sister manages the DSP team in Motorola Scotland , and when I
asked her about the 56001 compared to the AT&T DSP proposed for the Amiga , she
reckoned the 56001 was a vastly superior device , and I expect straight answers
from my family members , so maybe Commodore could be barking up the wrong tree ??

This sounds quite stupid, as this is nearly the price of a Falcon!!!
You better wait for the Falcon040, because I think Atari must make it

My motherboard looked like this:

W203 W201

```
-----------------
|
|
-
| LO
-
|
|
```

W202

and to get the "ABAB" combination as mentioned above, I had...

W203: pin 2&3
W201: pin 1&2
W202: pin 2&3

Try looking up under TOS 2.05 in the same book, as this was what I
originally had, and, according to HackBear, when he got his 2.06, he
got a new motherboard.

> I would also like to point out that all versions of the operating

I think it is you who has been fooled.
```

I have not yet seen a 1200 with any of the symptoms you describe.

The powersupply doesnt matter, as the overall consumption of the the computer is a lot lower than the 500 series, as are 2.5 inch drives.

I am very impressed with the drive on my 1200 (quiet..fast..etc)

As for a bunch of bollocks, you are obviously colour blind. The HAM8 mode does give you 256000 colours easily. (You didnt look at any ham6 pics by mistake did you?). The edsun chip merely uses a technique similar to the copper palette switching that has been available in all amigas since 1985. Maybe you were using low-quality software with bad HAM conversion?

You have obviously been the dumping-ground for a bad batch of 1200s...

Also, dont fool yourself about the Acorn. It may have 256 colour screens, but using only 16 colour registers. The ARM chip may be RISC, but the Acorn is still slower than an a1200 with fast ram (It has some wierd OS limitations). Dont flame me about the Acorn, but I read a document not 2 weeks ago comparing it to a 1200. It lost. I am not a fool, and the reasons given were reasonable.

Cheers.

G> the necessary parts from the large compressed file.

No, Datadiet doesn't prepare a partition. It just packs the files you're working with or that you want to be packed. If you create a txt file in Wordplus it will be packed upon exiting Wordplus.

All files are packed that are not PRG, TTP or TOS files and files specified in a Datadiet.inf file will not be packed (large GIF or JPG files for example).

It's all very configurable what you want packed and what not. Whole partitions, subdirs etc.

I've been using Datadiet for 1 year now and I'm very satisfied with it, never had any problems like crashes.

G> Also, is Data Diet available in England, from an English supplier
G> preferably.

It should be, has been reviewed in a few english mags.

I am interested too, but what about the copyright on these games? By
the way the program is never archived as zx81.lzh that is the zx81
emulator. No the spectrum emulator is called spectrum.lzh or something.
I know for sure it is on ftp.tu-clausthal.de. The speed is quite good,
but since I have no use for a spectrum emulator I do not use it
anymore. Schol daze would be fun. Was there ever an ST conversion of
School Daze? Perhaps of Back to school?

4509. The Straight Poop on the Amiga and Falcon DSPs

Newsgroup: comp.sys.atari.st
Date: 1993-03-22 16:41:46 UTC
From: SML108@psuvm.psu.edu
Message-ID: <93081.114146SML108@psuvm.psu.edu>
Source record: 208397
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.advocacy

Grabbed directly from comp.dsp, the list of capabilities of the Motorola 560001 andf the AT&T DSP3210...

Motorola:
DSP56001: 20.5, 27, or 33 MHz 24-bit fixed point DSP. 24 bit data bus, 16 bit address bus, 56 bit accumulators (2), host interface port, serial ports (2), general purpose I/O pins, timer. Harvard architecture. 512 words program RAM, 32 words bootstrap ROM, 512 words data RAM, 512 words data ROM on chip. Available in PGA, CQFP or PQFP packaging.

AT&T:
DSP 32C/3210: DSP32C, $70(1000); DSP3210, $50(100k)
32-bit floating point with 40-bits accumulator and 16/24-bit fixed point. These DSP's uses a single 4M-word (3210: 4G-word) linear memory space instead of the separate program and data memory found on most DSP:s. The bus can be accessed four times and each internal memory two times per cycle. The 3210, along with the VCOS operating system is intended for use on the mother board of personal computers and workstations where it shares memory with the host. The 32C has three 512 x 32-bit RAM:s while the 3210 has two 1k x 32-bit RAMs and a 256 x 32-bit boot ROM. 32C: Serial and parallell I/O, 3210: Serial I/O, timer, DMA-controller. 3210 available at 50 and 66MHz.

The NeXT and the Falcon use the 56001, while the Amiga and the new line of macintoshes will use the DSP3210...

Commence La Guerre de la DSP...

Source record: 208399

I use the Cold Cache 3.5 (PD) it's also give stats on cache hits and is only a read-cache.
I believe 'dcache' can cache writes too, but It only writes then when you tell it too (danger!!!).

Really I'd _love_ a read&write cache that simply makes sure that it writes out the write cache (in blocks if possible) when data in it is older than a second. If it put the floppy access light on too then I'd know when data was at risk......

It really irritates me when I see 'delete' takeing ages rewriting the same sectors over and over and over for each file.....

4511. FOR SALE : ST STUFF

Newsgroup: comp.sys.atari.st
Date: 1993-03-22 16:58:35 UTC
From: rahin@scs.leeds.ac.uk
Message-ID: <1993Mar22.165835.1455@lut.ac.uk>
Source record: 208304

I have the following ST peripherals and software for sale. Please
contact me via e-mail or phone (0532) 783346, evenings only.

1. AT-Speed : PC AT emulator for the ST UKP 70.00 ono

2. Power Computing 720KB external disk drive, UKP 35.00 ono
slimline, draws power through the joystick
port. Very quiet.

3. Prospero Pascal compiler. Very solid ISO UKP 35.00 ono
standard. Comes with full set of manuals
- more than 700 pages. Very good documentaion
on GEM AES & VDI. Version 2.xx.

4. HyperDraw drawing package, producing GEM UKP 10.00 ono.
metafiles.

P.S. Buyer pays the shipping.
Advanced apology if this sale notice propagates beyond UK.

- Rahin (rahin@scs.leeds.ac.uk)
(0532) 783346 (evenings only).

4512. Mega STE Problems Revisited

Newsgroup: comp.sys.atari.st
Date: 1993-03-22 17:42:27 UTC
From: psurge@cs.utexas.edu
Message-ID: <lqruk3INN60u@latexo.cs.utexas.edu>
Source record: 208398

For those who are podering my Mega STE problems with the red pixels on the screen and sparse startup, here are some new considerations:

Dispite what some have said about the memory (1x9 instead of 1x8), I do not believe that is the problem. When the original Memory was put back in, the problem persisted. I do not count the memory to be the source of the problem

JUMPERS:
When I pop open the front part of the case, there are sets of jumpers, could someone please tell me what they do:

A set of three next to the OS chips. The 2nd and 3rd are jumpered, the first is left bare.

A set of 5 next to the Memory chips. The first & 2nd and the 4th and 5th are each jumpered together, the middle (3rd) left alone.

I also remember one set near the back on the left side, two pins jumpered together.

Ok, when I changed the jumper next to the OS, Nothing happened when I turned the machine back on. When turned on with the jumper removed, bombs on the screen.

OS: Tos 2.05

When I switched the socketing of the OS chips, the same red dots appeared and nothing happened (as usual). This was also the case when I REMOVED both OS chips and switched the machine on WITHOUT the OS installed.

This means one of two things, either the OS is bad, or something is crashing before the OS even initializes. Like I said, the machine bombs whenever I can get the OS to boot (eventually bombs, that is). I know TOS 2.05 will not run some of the older programs, but I never heard of an OS that cannot execute itself.

SO, in summary, Should I get a new OS, or is there something else that causes this kind of problem.

Yes, this still exists...and it is still being updated. The program is
written by Darek Mihocka - the guy who wrote Quick ST. Gemulator is a
combination hardware/software emulator that runs ST stuff full speed on
about a 486-25. You can do all sorts of neat things like install different
versions of TOS, run TT modes, etc. I believe it runs in MS Windows...

Right, over here the MAC-LCIII (Student Rates), is approx' US$1700.

This is with a monitor, Hard-Drive etc. 32-bit BUS. And all the usual
mac' stuff.

4520. + How to upgrade 520STFM (UK) - Should I ? +

Newsgroup: comp.sys.atari.st
Date: 1993-03-22 20:03:10 UTC
From: gordonc@epcc.ed.ac.uk
Message-ID: <C4B3pA.67M@dcs.ed.ac.uk>
Source record: 208309

Hi,

I know this is ab it vague and wishy-washy, but :

I have an old 520STFM, still with only the standard 1/2 meg, and what's worse a single sided internal drive.

My question is, is it worthwhile me upgrading this to have some more memory (say, 2 or 4 megs) and a double sided drive, plus maybe a hard drive, or should I really just start from scratch again. I have a mono monitor also, which I'm quite happy with.....

As a bit of background, I'd like to use any machine I have basically for doing documents and prototyping C stuff, plus I'd like it to be nippy - also, I'd like the minimum of hassle (I use SGI and SUN w/stations at work), so maybe being able to get a UNIX clone would be good.

Anyway, I'm not sure whether I can upgrade my ST at reasonable cost to something a bit better, or whether just to get a 3 or 486 laptop, or maybe even a PoewerBook ? Any thoughts - I'm really just looking for any comments or feedback from people who have maybe found themself in the same situation...

If upgrading can be done cheaply, any ideas where to try - I know that getting parts for the STFM is a bit tougher/more expensive than for the STE....

Many thanks,
-G.

Over here (Columbus, OH, USA) it's about the same price (edu). The prices at the local Computer store (commerical) aren't really all that much higher, I think the whole kit-n-kaboodle is still under $2000 (although I'm not really sure how much a Mac 14" monitor goes for commerically). I know that the CPU can be had for <$1300. (Also note, you don't have to buy a *Apple* monitor...and that can save some $$$ right there...)

Of course, part of the initial savings for a Falcon is that you don't *have* to buy a monitor, you could use the TV.

Date: 1993-03-22 21:20:00 UTC
From: sillas@isvax.lmsc.lockheed.com
Message-ID: <22MAR199314200484@isvax.lmsc.lockheed.com>
Source record: 208313

I noticed on the back of my color monitor for my TT that there is a switch. I believe is says (TT - VGA). I also have a 386SX-33. My question is what kind of board would I need to hook up my TT monitor to the 386? Is it just a plan VGA board? Does anyone make a "Monitor Master" that I could switch back and forth between the 386 & the TT?

Thanks,
Dave

4524. Re: False advertisements (or morals of advertising)!

Newsgroup: comp.sys.atari.st
Date: 1993-03-22 21:54:38 UTC
From: jornmoe@fredrik.atari.no
Message-ID: <H.sjUOImCPxaU@fredrik.atari.no>
Source record: 208310

OK, so someone wrote an advert without checking thoroghly the facts,
naughty boy (or girl)!

But then what about the advertising morals of CBM who have copied postings
from this very newsgroup (the discussion on F030 and 16 vs 32 bit) and used
it without any permission of the source, to promote the A1200. As far as I
can understand, this is not good moral, and shows they'r realy desperat for
arguments to use in their advertising!!

I'm no lawyer, nor have I thorougly read the 'copyright' restrictions of the
net, but is it REALY alowed to take ANY text from a newsgroup and duplicate it
outside of the net, without some agreement with the source or net-
adminstration, like CBM did???

(Just curious)

>You're right! However: pop-up menus are faster to get at.

Pop-up menus are actually slower in many cases because a pop-up menu can only
hold the contents of ONE pulldown menu, unless you have pull-right submenus
in that menu, which makes it slower than a pulldown.

BTW, I find pop-down menus (Ataristyle) faster than pull-down menus (Macstyle),
but slightly less easy for newbies to use.

UGGGGhhhhh.....

Quit it, now!

Go to your respective corners and have fun with your own
computers!

It seems like we get very immature users onto the Internet!
How did ya get your accounts?

Get a life, Amigoids. Forget them Atarians. You're only
adding flame to the fire.

I THOUGHT THESE NEWSGROUPS ARE FOR EXCHANGING OF INFORMATON
BETWEEN like COMPUTERS...

CREATE A NEWSGROUP CALLED:

comp.sys.atari.vs.amiga.advocacy

AND/OR (for the benefit of amigoids):

comp.sys.amiga.vs.atari.advocacy

Good night.

Your anger should be directed towards your respective companies
(ATARI/commodore).... tell them to make better machines...
have better support... better advertisement....

Why waste your time with other peons?

Sure, they can affect some to buy... but the bottom line goes
to the responsiilities of companies....

With all of this bickering, maybe we should let Microsoft gobble
the rest of the market...

How about it, your refering to a 8 year old computer!! What do you expect, every model be supported for ever? C= did leave the A1000 guys out a a limb but at least they didn't drop them flat like Atari as with nearly anything they've ever made.

>How about the different types of A2000? If you are unlucky and got
>one of the old A2000 you can just throw it away because nothing is the
>same as with the second version... I know people with that problem.

Come on, the model of the A2000 that was substantially different to today's, (or should i say yesterday's), model exists in such small numbers that no one worries about it. It strange that all your friends own these rare machines.

Anyone know if there is an overscan that works on a Mega/STE w/ 2.06 TOS?

And is there a program that will convert IFF's to say GIF? I have some 640x400 IFFs I wanna convert to something so I can scale them to 320x200 PC1 for bootup... I tried Genshow, but it goes in the current resolution, so if in medium, it does 4, and if in low it does 16... Also want something to convert a .TIFF to something like GIF, I have a .TIFF of the falcon (looks good on a PC down the hall, but I wanna see it on MY machine...).

Yes, there is. You could use a sector editor to change the FAT entry for
this sector (that is, the cluster this sector belongs to). I don't remember
exactly what value you had to write, though...

> in the loss of data and quite possibly a head crash.

There are some things to say about that:

1. Writing small blocks is not the whole story.

2. Without a cache, the sequence of the events when deleting files is:
* process deletion request
- delete one file
* process next request
- delete next file
...
Whenever you come to a * step, FATs, directories and data area
are in a consistent state. That means that while processing you're
always safe. In your example above, this takes 30 seconds from
the total 45 seconds, leaving 15 seconds "unsafe".

With a write cache, you never really know when data will be written,
so you can't say you're in a safe state until 30 + 0 + 2 seconds
are over.

> In addition there is little reason for paranoia about power failures which
> occur on average once every two years and even then 90% of the time during
> high winds, electrical storms, or when the company had already told you it
> was going to be switched off for maintainance work, when you should have the
> common sense not to use the computer.

Power failure is not the only thing that can happen to you: Programs
may crash before the buffers have been flushed; you could forget to
wait the extra 2 seconds before switching off your computer after
a programming session; the monitor or power cable could be
plugged off accidentally, causing a reset or power-down.

There are other problems with write caches: For the caller,
writes to the buffer never fail; errors on the disk can only
be detected when the data is written, and it may be too late
then.

This leads me to the conclusion that without a good file system
check & repair program, I wouldn't want to use a write cache
for all partitions. I might be convinced to use it selectively
for partitions for which I make backup copies frequently.

>seriously, I'm very curious...

Well, the A1000 was followed by the A500. Would you say the A500 is better
than the A1000? Surely not.

A short while later the A1000 was cancelled and replaced by the A2000, with
it's huge, terrible case. An upgrade of the A1000 board would have been
enough, but the way Com. did it, the A1000 was given up completely (I'm
bot speaking of now, but some 3 or 4 years ago).

Certainly the A3000 is nicer than A1000 meanwhile - but that's a whole
class bigger and 2 generations later.

> Stuart, but just to give another side to the story.

Really it's a case of a number of things having gone wrong rather than Ladbroke being a bad company to deal with. In summary, I sent off my ST for PSU repair plus TOS upgrade on 12/1/93 and didn't get it back in working condition till 25/2/93; that's over six weeks (during which time the work I delegate to my ST piled up! :-( ). Delays included Ladbroke running out of stock of TOS 2.06, the ST being returned once in non-working order (they reckoned it must have been knocked in transit) and couriers not collecting on the arranged day. It seems to take just under a week for Ladbroke to service an ST (on each occasion) and a week to provide the initial quotation, so further delays gave rise to a long wait.

I wouldn't myself say that Ladbroke is a place for everyone "not to use" and I suppose I was basically unlucky; but I found the hassle and delay galling. The problems I experienced were not perhaps their "fault" but as a customer I do regard it as ultimately their responsibility. The Ladbroke staff were fairly sympathetic in their handling of the matter, but my opinion of Ladbroke would be higher had I received a word of apology or a note regretting the delay along with the receipt. Business sense and common courtesy surely dictate that you convince your customers that their custom is valued.

P.S. TOS 2.06 is a very good upgrade (apart from the grating disk drive referred to in other posts!) and I've every reason to believe that Ladbroke did a good job. Unfortunately I had to solder one of the wires to the battery compartment back as it had apparently been broken at some point during the repairs or reassembly (an easy and hard-to-spot accident, I suppose), so the "Warning! Removal of this seal voids all warranty claims" stickers covering the case's screws had to go in the bin... :-/

This fact (MIDI) is not true. The Amiga does not come with any MIDI ports.
Period. The Atari comes with two (should be three, but...). At least Atari did
get that bit correct.

The other bits I agree with.

> Blatant Omissions: [NOT ILLEGAL... BUT.....]

This is wrong. A 68000 is 32 bit processor. It has a 16 bit databus. It is
still a 32 bit chip.

As for this... well it may not be illegal not to mention what's better in the
competition. The Tory party have hoodwinked the public in the UK this way for
years...

> OH WELL BEFORE I SAW THIS ADVERT I WAS GOING TO BUY A FALCON. BUT IF THIS

I think this is done by simply adding a second shifter to the one
already in your ST. This way even 32768 colors can be made. Check out
the docs at atari.archive; complete circuitry layout can be get from
the author. I have it all at home, just never got to actually making
it. I have two fried STs lying around, of which the shifters should be
OK. Maybe I'll try it once, after I bought my Falcon :-)

SS> the job.

I am also using cachennn but I have occasionally problems with swapping
floppies. I usually work from a CLI (e.g. gulam), and recently I destroyed
a floppy's contents apparently because the cache contained sectors from the
previous floppy and didn't flush the cache when I changed floppies. I think
what happened was that I cd'ed to, a subdirectory and then did a rm * but
apparently the cd had not don its job properly (I checked with pwd that I
was in the directory, but still it deleted the files from the main
directory).

I have also had occasions where a floppy was completely damaged.

Are there any caches that do this properly?

Ages ago I wrote one for my STfm (tos1.02, I think) and it worked (not perfectly, couldn't get a few things to run). I was going to post it, but when I got my STe, I found that it didn't work (hmmm... must be all the fiddling about with system variables and interrupts and stuff! :-) I haven't had time to sort it out again. I can send people what I did, if they're interested.

The offshoot from this is that at work I wrote a version for the Suns (in C and X-Windows) - this version was much more compatible (I tried to emulate everything in the Z80) - Although still couldn't get everything to run. Anyone interested in a copy?

Andrew.

stunning (good) argument about the chance of damage occurring because of power
breakdown being LESS with the ICD driver

There is one thing:-- I had to learn to wait 1 second (I think the delay of
ICD is 1 rather than 2 seconds) before I hit the RESET button when an exception
has happened. I've made the mistake of hitting it too early some 20 times
before I got the hang of it. Twice or three times, I lost parts of files.

I remember awhile back of a cable you can build for the ST Xformer (the
8bit emulator) so you can hook up 8bit drives. I would like to know if
anyone can point me in the direction to be able to find the docs.

Thanks...

Later.......

>seriously, I'm very curious...

I've owned two Amigas so far. An original A1000 without even the EHB
Denise Chip, and an Amiga 2000HD which I've upgraded considerably.

Back when I owned the A1000, I started with two floppy drives and
a 1080 monitor. It wasn't bad, except for the Hi res flicker. Also
Not so much stuff needed a hard drive in those days. 1.1 - 1.3
worked reasonably well with one floppy disk worth of Workbench.

Physical layout of the A1000: the detachable keyboard and floppy
disk in the front was great.

I upgraded to the A2000HD however, for two reasons the Hard Drive and
the possiblility of a flickerFixer. Since then I've replaced the original
hard drive & added a 2630 card 1 Meg Agnes & 2.0 / 2.1

From what I understand, the AT&T DSP does floating point math where the
Motorola chip only does integer math

Keep in mind that the gentleman mentioned the latest being v031993, that's only
4 days ago. So you might pick some good information in it.

I've always thought business is business; if you have a buyer and a seller,
why not? Japan can buy anything if someone wants to sell to them. But I'll
be picking up a copy just to see what Japan might be trying to do.

I don't know how things are arranged in Austrialia, but have you contacted the equivalent of the trading standards? I generally support Atari, but every single point made in that advertisement was either wrong or misleading.

Atari deserve to be fined by the authorities and the person responsible sacked.

- Leo

Hi, here at the Uni, i've been doing my final year project on the 1040ST's we have. I've been using Devpac 2 to create linkable files, and linking them with linkST. Up to now this has been done on the floppy disk. Then i found that we have a hard disk (one of the really old ones made by Atari, its about the size of a shoe box). I've connected it up, but, being an amiga man myself, i dont know what else needs to be done in order to use it. Do i need to install a new drive icon? If so what letter does it need to be?

I would appretiate help as soon as possible, as the project deadline draws near!

Thanx in advance,

Steve.

buzy@midway.uchicago.edu has crossposted a message regarding Japanese bus. practices to many (mostly inappropriate) newsgroups. At the moment, he/she cannot recieve mail, but when he can, I provide the following hack to send to buzy@midway.uchicago.edu.

This program automatically counts the number of commas in your newsgroups: line, adds one and uses this number as the number of messages to send to you. Before you huff in anger, consider two things: 1) the number of messages sent to you is roughly* equal to the number of inappropriate crosspostings you have made, and 2) the files sent to you could easily have been several megs apiece. In the future, please determine whether the newsgroup you target is (much more than) remotely connected topic-wise. You might also read the news-group in question in order to rule out sending due to either a) having no connection whatsoever with the topic you want to discuss (I repeat: discuss) or b) having already run the topic into the ground. Note that it may take extensive searching to determine how long ago a topic has been run into the ground, and apparently eons for you to decide if that topic is connected. I strongly suggest you take this time, and more if necessary.

* algorithm for determining whether message has already been sent to you has not yet been implemented. (oops...)

> true here in Ottawa unless the price of the falcon suddenly sky-rockets to
> $2200. Mac's always have/are/will be WAYYYYY to expensive (for me at least:)

That price includes the superb Apple 14" Trinitron monitor (at least it does in Toronto). The LCIII by itself is CDN$1689 (the 4/80). The Falcon 4/65 was projected to be US$1399 I think, which is around CDN$1750, with no monitor. So the Falcon will cost more than an LCIII, which is very bad. I won't go into the specs of the LCIII since this isn't a Mac group, but it will be a big blow to the Falcon.

You cannot access the files in the 'New' directory. These are recent uploads an until the 'librarian' tests them and moves them to 'Newitems' you are out of luck.

Bob

Well, Atari Canada was "rightsized" out of existance by Sunnyvale; since then, TTs and other Atari hardware has become _scarce_, IF you can get it.

There are about three stores in Toronto, Ont. that have Atari stuff in there; DMC Marketing (formerly ISD; ie, the importers of Calamus to North America).

Oh, rumour also has it that there's a store in London that keeps > 1,000 ST programs in stock...

Essentially, there is nothing within 100km of most people.

> still a 32 bit chip.

Incorrect. Admittedly from a software perspective the 68000 _appears_ as a
32bit processor due to the 32bit instructions and registers. However if
one considers the internal workings this illusion is destroyed quickly.
It is internally a 16 bit processor, in particular the ALU is 16bit. Thus
to perform 32bit operations it must perform two 16bit operations.

The 68020 is indeed a fully 32 bit processor, comparable to the 80386. Even
the 68ec020 is a fully 32bit processor except for only 24 bits of address
space appearing on the outside. This only limits the addressing range to
16Mbytes, but does not impair speed of operation.

Interesting... In New Zealand one could very easily be taken to court for such
advertising under the Fair Trading Act. In fact, it is one of the "pet
assignments" of one of the lecturers in the accounting department here at
Canterbury to get his students to seek out false advertising and then threaten
to take the party concerned to court. They have gained many a free stereo and
other goodies in out of court settlements!

I'm also thinking of having CBM, NZ up for it too. They advertise the a1200
and a4000 as having speech capability as standard, as which we know,
they don't (due to the dropping of the speech stuff from 3.0). Could be a lot
fun :-)

Well I guess Atari will have to lower the price on the vaporware Falcon. Sears is selling the Apple Performa 400 which comes with 4 megs, 80 meg HD, keyboard and claris works preinstalled for 975 including tax and shipping. Apple provides an 800 number support.

Yah it is... an exchange of information on the differences btw the marketing tatics of Atari and CBM as well as how well the A1200 can kick Atari's *** . :)

> With all of this bickering, maybe we should let Microsoft gobble
> the rest of the market...

Horrors!! Let Microsoft lead the way? Arrgghhh.. Amigans Unite! Let's kick MS back where it belongs!!!

>From what I understand, the AT&T DSP does floating point math where the
>Motorola chip only does integer math

The AT&T chip does quite a great deal of floating point as well! In the order
of 35 MFlops, or 35 times that of a 486, or 10 times that of an 040, depending
on how you want to look at it.

The AT&T chip as a complete suite of software development tools (compilers,
assemblers, debuggers etc) and runs its own operating system. Apparently
it can perform most operations asyncronously (freeing the CPU). More
to the point, with its own OS, very few concessions have to be made
in the operating system to incorporate it into a machine's architecture.

>chip?

Because the people who designed the 8-bit atari's are not the ones who designed the 16-bit ones. The person responsible for the Atari 8-bitters ANTIC helped to design the Amiga for Amiga Inc. (which was eventually sold to C=).

4571. TCache 5.9 Help - Please...!

Newsgroup: comp.sys.atari.st
Date: 1993-03-24 07:13:02 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.B3bMhXNSGsw@elfhaven.ersys.edmonton.ab.ca>
Source record: 208432

Hi.

I've been using TCache 5.2 for a long time now, and I just got the newest version.

There are a lot of new options, and since I do not speak German, I decided to come to the good folks of comp.sys.atari.st for help.

The two most important new options that I have seen are the etv_term option and the GemDos option. What do these do? From the little bit of the documentation I understood, they seem important.

Also, there are some on/off buttons in the 'Zubehoer' dialog that I do not understand. For example, what does the Virtual Drive do, and what do the Uhr, Drvbit-Check, and XBRA-Check do?

Any help would be greatly appreciated.
